CAPSTONE TURBINE CORPORATION

(Exact name of registrant as specified in its charter)

Delaware

(State or other jurisdiction of
incorporation or organization)

21211 Nordhoff Street, Chatsworth, California 91311

(Address of principal executive offices) (Zip code)

95-4180883

(I.R.S. Employer
Identification No.)

818-734-5300

(Registrant's telephone number, including area code)

Securities registered pursuant to Section 12(b) of the Act: **None**

Securities registered pursuant to Section 12(g) of the Act:

Title of Class Common Stock, par value \$.001 per share

Series A Preferred Stock Purchase Rights

Name of Exchange on which Registered NASDAQ

Indicate by check mark if the registrant is a well-known seasoned issuer, as defined in Rule 405 of the Securities Act. Yes No

Indicate by check mark if the registrant is not required to file reports pursuant to Section 13 or Section 15(d) of the Act. Yes No

Indicate by check mark whether the Registrant: (1) has filed all reports required to be filed by Sections 13 or 15(d) of the Securities Exchange Act of 1934 during the preceding 12 months (or for shorter period that the Registrant was required to file such reports), and (2) has been subject to such filing requirements for the past 90 days.

Yes No

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

Indicate by check mark if disclosure of delinquent filers pursuant to Item 405 of Regulation S-K is not contained herein, and will not be contained, to the best of the Registrant's knowledge, in definitive proxy or information statements incorporated by reference in Part III of this Form 10-K or an amendment to this Form 10-K.

Indicate by check mark whether the registrant is a large accelerated filer, an accelerated filer, or a non-accelerated filer. See definition of accelerated filer and large accelerated filer in Rule 12b-2 of the Exchange Act. (Check one):

Large accelerated filer

Accelerated filer

Non-accelerated filer

Indicate by check mark whether the registrant is a shell company (as defined in Rule 12b-2 of the Exchange Act). Yes No

The aggregate market value of the shares of Common Stock of the Registrant held by non-affiliates on September 30, 2006 was \$138.7 million.

As of June 6, 2007, 143,987,706 shares of the Registrant's Common Stock were issued and outstanding.

DOCUMENTS INCORPORATED BY REFERENCE

Portions of the definitive proxy statement relating to the Registrant's 2007 Annual Meeting of stockholders are incorporated by reference into Part III of this report to the extent described therein.

Item 1. Business.

Overview

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

We develop, manufacture, market and service microturbine technology solutions for use in stationary distributed power generation applications, including cogeneration (combined heat and power (CHP) and combined cooling, heat and power (CCHP)), resource recovery and secure power. In addition, our microturbines can be used as generators for hybrid electric vehicle applications. Microturbines allow customers to produce power on-site in parallel with the electric grid or stand alone. There are several technologies which are used to provide on-site power generation , also called distributed generation , such as reciprocating engines, solar power, wind powered systems and fuel cells. For customers who do not have access to the electric utility grid, microturbines can provide clean, on-site power with lower scheduled maintenance intervals and greater fuel flexibility than competing technologies. For customers with access to the electric grid, microturbines can provide an additional source of continuous duty power, thereby providing additional reliability and in most instances, cost savings. With our stand-alone feature, customers can produce their own energy in the event of a power outage and can use the microturbines as their primary source of power for extended periods. Because our microturbines also produce clean, usable heat energy, they can provide economic advantages to customers who can benefit from the use of hot water, air conditioning and direct hot air. Our microturbines are sold primarily through our distributors and dealers. We, along with our Authorized Service Companies (ASCs), provide installation and service. Successful implementation of the microturbine relies on the quality of the microturbine, the ability to sell into appropriate applications, and the quality of the installation and support.

We believe we were the first company to offer a commercially available power source using microturbine technology. Our 30- kilowatt (Model C30) and 60 and 65 kilowatt (C60 Series) products are designed to produce electricity for commercial and industrial users. A Model C30 product can produce enough electricity to power a small convenience store. The C60 Series products can produce enough heat to provide hot water to a 100-room hotel while also providing about one-third of its electrical requirements. Our microturbines combine patented air-bearing technology, advanced combustion technology and sophisticated power electronics to form efficient and low emission electricity and heat production systems. Because of our air-bearing technology, our microturbines do not require liquid lubricants. This means they do not require routine maintenance to change oil or other lubrications, as do the most common competing products. The Model C30 product can be fueled by various sources including natural gas, propane, sour gas, renewable fuels such as landfill or digester gas, kerosene and diesel. The C60 Series can be fueled by natural gas or renewable fuels such as landfill or digester gas. The C60 Series products are available with an integrated heat exchanger, making it efficient to install in applications where hot water is used. Our products produce exceptionally clean power. In terms of nitrogen oxides (NOx) emissions, our microturbines have been shown to consistently produce less NOx than conventional reciprocating engines including those designed for natural gas.

Stationary applications for our microturbines, either independent of, or connected to, the electric utility grid, are extremely broad. The primary stationary markets that we have sold products to include:

- **Cogeneration CHP and CCHP** Cogeneration maximizes the use of energy produced by the microturbines and enhances the economic advantage for customers. Cogeneration is a market that seeks to use both the heat energy and electric energy produced in the power generation process. Using the heat and electricity created from a single combustion process increases the efficiency of the system from approximately 30% to 70%, or more. The increased operating efficiency often reduces overall emissions and, through displacement of other separate systems, can reduce variable production costs. The most prominent uses of heat energy include space heating and air conditioning, heating and cooling water, as well as drying and other applications. For example, we have used the heat generated by the microturbines to supply hot water solutions for hotels and schools. When our microturbine exhaust fuels an absorption chiller, the chiller produces chilled water for air conditioning and other uses. These systems have also been implemented to supply solutions in grocery stores and manufacturing applications.

There are potential markets for CHP and CCHP applications in North America, Europe, Russia and parts of Asia. Many governments have encouraged more efficient use of the power generation process to reduce pollution and the cost of locally produced goods. Japan, which has some of the highest electric power costs in the world, has been particularly active in exploring innovative ways to improve the efficiency of generating electricity. To access this market, we have entered into agreements with distributors, which have engineered CHP packages that utilize the hot exhaust air of the microturbine for heating water and also use the hot exhaust to run an absorption chiller for air conditioning. Further, we have developed our own integrated CHP product where the heat exchanger is placed on top of the C60 Series product. This provides a pre-engineered solution for hot water applications.

- **Resource recovery** On a worldwide basis, there are thousands of locations where the production of fossil fuels and other extraction and production processes create fuel byproducts, which traditionally have been released or burned into

the atmosphere. Our microturbine products can use methane gas from landfills and wastewater treatment facilities and can burn these waste gases with minimal emissions, thereby, in some cases, avoiding the imposition of penalties incurred for pollution, while simultaneously producing electricity for use at the site or in the surrounding community. Our microturbine products have demonstrated effectiveness in this application and outperform conventional combustion engines in a number of situations, including when the gas contains a high amount of sulfur. These gases are considered renewable resources or other anaerobic digestion processes.

- **Secure power** The need for secure power is becoming more apparent with recent world events. On May 24, 2006 we received our first Materials Equipment Acceptance (MEA) approval from the New York City Department of Buildings MEA Division and the New York Fire Department.

Because of the potentially catastrophic consequences of even momentary system failure, certain power users, such as high technology and information systems companies, require particularly high levels of reliability in their power service. Capstone microturbines can follow levels of demand, providing prime power with N+1 redundancy when other sources fail. Dual mode units operating in a prime power configuration can support a 150% overload for 10 seconds during transient conditions. Dual mode units operating in grid parallel mode can provide customers a back-up power system with an economic payback. These systems offer high onsite energy efficiency when combined with a heat exchanger (CHP) to create hot water or with a chiller (CCHP) for air conditioning at these facilities. This configuration, when combined with the Capstone Dual Mode Controller, can transition from the grid parallel mode to prime power mode in less than 10 seconds.

With opportunities created by deregulation in the electric utility industry and increased reliance on sensitive digital electronics in day-to-day life, industrialized societies are increasingly demanding high quality, highly reliable power. End customers with greater freedom of choice are investigating alternative power sources to protect their business operations and equipment from costly interruptions. Customers who are charged peak rates by utilities can use microturbines to peak shave or self-generate electricity to manage their electric consumption to avoid costly peak demand charges.

Utilities also can take advantage of Capstone MicroTurbines® to avoid costly transmission and distribution system expansion or upgrades in uncertain growth or weak areas in the electric utility grid. These companies can place our microturbines where the electrical power is needed. The microturbines can supply power in conjunction with the power provided by the utility's standard generation and transmission equipment. In the alternative, the utility can use the microturbines to provide power during times when demand for power is at its highest, potentially reducing the need for expensive expansions to the central power plant. Rural electric cooperatives and electric utilities may use our microturbines as a stand-alone system to provide temporary or back-up power for specific applications or to provide primary power for remote needs.

- **Vehicular Application** Our technology is also used in vehicular applications. Our customers have applied our products in hybrid electric vehicles such as buses and railcars. We have continued to explore development of vehicular applications, such as advanced military applications and auxiliary power systems for naval vessels. Vehicular applications could become a focused area for development if a significant market demand for a vehicular application emerges.

We sell complete microturbine units, subassemblies, components and various accessories. We also remanufacture microturbine engines and provide after-market parts and services. Our microturbines are sold primarily through distributors and dealers, although we also have a direct sales effort in portions of the United States. Our distributors purchase our products for sale to end users. The distributors are also required to provide a variety of additional services, including engineering the applications in which the microturbines will be used, installing the products at the end users' sites, commissioning the installed applications and providing post-commissioning service. Our distributors perform like value-added resellers. Some distributors, that we call Original Equipment Manufacturers (OEMs), integrate Capstone's products into their own product solutions. Dealers are like distributors in that they purchase our products for sale to end users and also provide application engineering and installation. However, dealers are different from distributors in that dealers do not perform commissioning or provide post-commissioning service. Capstone has also established some outside sales representatives who qualify and close customer orders. The order is then booked directly by Capstone. Capstone has a factory direct service offering for commissioning and post-commissioning service in selected areas of the United States. All of our distributors are ASCs. We also have ASCs who do not sell our products, but only offer service for them. Successful implementation of the microturbine depends upon the quality of the microturbine, the ability of the distributors and dealers to sell into appropriate applications, and the quality of installation, commissioning service and support provided.

Our Products

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

We began commercial sales of our Model C30 products in 1998, targeting the emerging distributed generation industry that was being driven by fundamental changes in power requirements. In September 2000, we shipped the first commercial unit of our C60 Series microturbine. We began shipping the C60 Integrated CHP solution in 2003 and first shipments of the C65 models occurred during the quarter ended March 31, 2006. Our total installed microturbines have logged more than 15 million operating hours. We are still in the early phases of commercializing this technology and, to date, have not been profitable or generated positive cash flow.

Our backlog as of March 31, 2007 was approximately \$5.0 million or 5.5 megawatts. As of March 31, 2006 our backlog was approximately \$7.1 million or 7.6 megawatts. The backlog reflects orders that we considered firm, however, cancellations may occur and will be reflected in our backlog when known.

Capstone MicroTurbines are compact, environmentally friendly generators of electricity and heat. They operate on the same principle as a jet engine with the added capability of using a variety of commercially available fuels, such as natural gas, diesel, kerosene and propane, as well as previously unusable or underutilized fuels. For example, our microturbines can operate on low British Thermal Unit (BTU) gas, which is gas with lower energy content, and can also operate on gas with a high amount of sulfur, known in the industry as sour gas. Examples of these fuel sources include methane from facilities such as wastewater treatment plants, landfills or agrodigesters. The compact and light-weight, modular design provides for flexibility in installing our microturbines in applications that are not suitable for other distributed energy devices.

Our microturbines incorporate three major design features:

- advanced combustion technology;
- patented air-bearing technology; and
- digital power electronics.

Our advanced combustion technology allows the Capstone MicroTurbines to achieve low emissions capability with a design that is simple to manufacture. These low emission levels not only provide an environmentally friendly product, but also eliminate permitting requirements in several municipalities for continuously operated onsite power generation. The air-bearing system allows the microturbine's single moving assembly to produce power without the need for typical petroleum-based lubrication. Air-bearings use a high-pressure field of air rather than petroleum lubricants. This improves reliability and reduces maintenance, such as oil changes. The electronic controls manage critical functions and monitor operations of the microturbine. For instance, our electronics control the microturbine's speed, temperature and fuel flow and communicate with external computers and modems. The power electronics coordinate with the demand signals provided by customers, with the grid when the units are operated in a grid-connect mode and with the on-board battery when equipped for stand-alone mode. All control functions are performed digitally. Performance is optimized, resulting in lower emissions, higher reliability and high efficiency over a variable power range.

Our Model C30 and C60 Series products are approximately the size of a large refrigerator. Our Model C30 generates approximately 30 kilowatts of electric power, which is enough to power a typical convenience store, and approximately 300,000 kilojoules per hour of heat, which provides enough energy to heat 20 gallons of water per minute with a 20-degree Fahrenheit temperature rise. Our C60 Series products are designed to similar criteria, and generate approximately 60 to 65 kilowatts of electric power. The electrical output of our units can be paralleled in multiple unit configurations through our Advanced Power Server product and a digital communications cable to serve larger installations requiring electrical loads up to two megawatts.

Our products can operate:

- connected to the electric utility grid as a current source;
- on a stand-alone basis as a voltage source;
- multipacked to support larger loads as a virtual single unit; and
- dual mode, where the microturbine operates connected to the electric utility grid as a current source when grid voltage is available, and, when combined with the optional Dual Mode Controller, can automatically sense that grid voltage is no longer available, disconnect itself from the grid and reconfigure the microturbine output as a voltage source within 10 seconds to operate on a stand-alone basis.

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

We also offer C60 Series Integrated CHP systems. These systems combine the standard C60 Series microturbine unit with a Heat Recovery Module that provides electricity and heats water in a single package.

4

Our family of products is currently available (X) in the following configurations:

Product Configurations

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

	Model C30 Grid Connect	Stand- Alone	C60 Series Grid Connect	Stand- Alone	Integrated CHP
Low pressure natural gas	X	X	X	X	X
High pressure natural gas	X	X	X	X	X
Low BTU gas	X		X		X
Sour gas	X	X	X	X	X
Gaseous propane	X	X	X	X	X
Compressed natural gas	X	X	X	X	X
Diesel	X	X			
Bio-diesel	X	X			
Kerosene	X	X			

We offer various accessories for our products including rotary gas compressors with digital controls, heat recovery modules for CHP applications, dual mode controllers that allow automatic transition between grid connect and stand-alone modes, batteries with digital controls for stand-alone or dual-mode operations, power servers for large multipacked installations, protocol converters for Internet access, packaging options and miscellaneous parts such as frames, exhaust ducting and installation hardware. We also sell microturbine components and subassemblies to OEMs.

The Capstone MicroTurbine consists of a turbogenerator and our patented electronic controls, combined with ancillary systems such as a fuel system. The turbogenerator includes a mechanical combustor system and a single moving assembly rotating on our patented air-bearings at up to 96,000 revolutions per minute. The combustor system operates on a variety of fuels and, at full power, achieves NOx emissions levels in the exhaust of less than nine parts per million per volume with natural gas and less than 35 parts per million per volume when operating with diesel. The C60 iCHP Natural Gas systems are certified to the California Air Resources Board (CARB) 2003 emissions standards for distributed generation installed in California and certification of this configuration to the CARB 2007 standard is pending. As a result of our patented air-bearing technology, our microturbines do not require liquid lubrication. In addition, our microturbines do not utilize liquid cooling, keeping scheduled maintenance costs extremely low throughout their useful life.

Our electronic controls include an air cooled, insulated gate bipolar transistor (commonly known as IGBT) based inverter with advanced digital signal processor based microelectronics. These electronics control and manage the microturbine using proprietary software and advanced algorithms. The controls:

- start the turbogenerator and manage its load;
- coordinate the functioning of the microturbine with the grid;
- manage the speed, fuel flow, and exhaust temperature of the microturbine;
- convert the variable frequency, up to a maximum of 1,600 Hertz, and variable voltage power produced by the generator into a usable output of either 50/60 Hertz AC or optionally DC for HEV applications; and
- provide digital communications to externally maintain and control the equipment.

In addition, our proprietary Capstone Remote Monitoring Software (CRMS) provides an advantage to end-users by allowing them to remotely operate and manage the microturbine. Unlike the technology of other power sources that require manual monitoring and maintenance, the microturbine allows end-users to remotely and efficiently monitor performance, power generation and time of operation using our CRMS interface software with standard personal computers. This remote capability can provide end-users with power generation flexibility and cost savings. During the fiscal year ended March 31, 2006, referred to herein as Fiscal 2006, we also initiated an internet based communication system, the Capstone Service Network, to provide continuous remote monitoring and diagnostics. If the Capstone Service Network detects an out-of-limit condition or alarm, it automatically notifies the responsible ASC for immediate follow up action. This is expected to result in even higher levels of power availability and customer satisfaction.

The Model C30 was initially designed to operate connected to an electric utility grid and using a high pressure, natural gas fuel source. We have expanded its functionality to operate with different fuels including a variety of carbon-based fuels such as propane, sour gas, kerosene and diesel. The combustor system remains the same for all fuels, except for the fuel injectors, which currently vary between liquid and gaseous fuels. The Capstone MicroTurbine's multi-fuel capability provides significant competitive advantages with respect to some of our selected vertical markets.

Our Model C60 Series grid-connect and stand-alone microturbine power systems meet the Underwriters' Laboratories certification for the UL 2200 stationary engine generator standards and the UL 1741 utility interconnection requirements. Our products are manufactured by processes that are ISO 9001 certified.

In 2002, the California Energy Commission certified our 30-kilowatt and 60-kilowatt microturbine power systems as the first products to comply with the requirements of its Rule 21 grid interconnection standard. This standard streamlines the process for connecting distributed generation systems to the grid in California. The benefits of achieving this standard include avoiding both costly external equipment procurement requirements and extensive site-by-site and utility-by-utility analysis. Our protective relay functionality has also been recognized by the State of New York which has pre-cleared our microturbines for connection to New York's electric utility grid.

Our 60-kilowatt microturbine power system was the first mechanical power generation product to be certified by the State of California as meeting its stringent distributed generation emissions standards that went into effect in 2003.

During Fiscal 2006, we became the first microturbine manufacturer to achieve Underwriter's Laboratories Class I, Division 2 certification for operation in hazardous-area oil and gas applications. These specially packed systems are applied in oil and gas production areas with potentially explosive environments.

Applications

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

Worldwide, stationary power generation applications vary from huge central stationary generating facilities, above 1,000 megawatts, down to back-up uses below ten kilowatts. Historically, power generation in most developed countries, such as the United States (U.S.), has been part of a regulated system. A number of developments related primarily to the deregulation of the industry, as well as significant technology advances, have broadened the range of power supply choices available to customers. We believe that our microturbines will be used in a variety of innovative electric power applications requiring less than three megawatts and, more immediately, in those requiring less than 500 kilowatts. Within the distributed generation markets served, we focus on vertical markets that we have identified as having the greatest near-term potential. In the markets we are focusing on (secure power, CHP, CCHP and resource recovery), we have identified specific targeted vertical market segments. Within each of these markets, we have identified what we believe to be the critical factors to penetrating these markets and have built plans around those factors.

Cogeneration CHP / CCHP

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

Cogeneration is a market that seeks to use both the heat energy and electric energy produced in the power generation process. Using the heat and electricity created from a single combustion process increases the efficiency of the system from approximately 30% to 70%, or more. The increased operating efficiency often reduces overall emissions and, through displacement of other separate systems, can reduce variable production costs. The most prominent uses of heat energy include space heating and air conditioning, heating and cooling water, as well as drying and other applications.

There are potential markets for CHP and CCHP applications in North America, Europe, Russia and parts of Asia. Many governments have encouraged more efficient use of the power generation process to reduce pollution and the cost of locally produced goods. To access these markets, we have entered into agreements with distributors, which have engineered CHP packages that utilize the hot exhaust air of the microturbine for heating water and also use the hot exhaust to run an absorption chiller for air conditioning. Further, we have developed our own integrated CHP product where the heat exchanger is placed on top of the C60 Series product. This provides a pre-engineered solution for hot water applications.

Resource Recovery/Renewable Fuels

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

On a worldwide basis, there are thousands of locations where the production of fossil fuels and other extraction and production processes creates fuel byproducts, which traditionally have been released or burned into the atmosphere. Our microturbines can burn these waste gases with minimal emissions, thereby, in some cases, avoiding the imposition of penalties incurred for pollution, while simultaneously producing electricity for use at the site or in the surrounding community. Our microturbine products have demonstrated effectiveness in this application and outperform conventional combustion engines in a number of situations, including when the gas contains a high amount of sulfur. We have sold systems that were installed in

6

the resource recovery market to be used at oil and gas exploration and production sites. We have also sold systems to be used to burn gases released from landfills and wastewater treatment facilities. These gases are considered renewable resources.

Secure Power

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

The need for secure power is becoming more apparent with recent world events. On May 24, 2006 we received our first MEA approval from the New York City Department of Buildings MEA Division and the New York Fire Department.

Because of the potentially catastrophic consequences of even momentary system failure, certain power users, such as high technology and information systems companies, require particularly high levels of reliability in their power service. Our microturbines can follow levels of demand, providing power when other sources fail. Our products can be configured in multiple unit arrays and used in combination to provide a highly reliable electricity generating system. We believe that customers with particularly low tolerances for power service interruptions represent a growing and long-term potential market for our microturbine products.

With opportunities created by deregulation in the electric utility industry and increased reliance on sensitive digital electronics in day-to-day life, industrialized societies are increasingly demanding high quality, highly reliable power. End customers with greater freedom of choice are investigating alternative power sources to protect their business operations and equipment from costly interruptions. Customers who are charged peak rates by utilities can use microturbines to peak shave or self-generate electricity to manage their electric consumption to avoid costly peak demand charges.

Utilities also can take advantage of Capstone MicroTurbines to avoid costly transmission and distribution system expansion or upgrades in uncertain growth or weak areas in the electric utility grid. These companies can place our microturbines where the electrical power is needed. The microturbines can supply power in conjunction with the power provided by the utility's standard generation and transmission equipment. In the alternative, the utility can use the microturbines to provide power during times when demand for power is at its highest, potentially reducing the need for expensive expansions to the central power plant. Rural electric cooperatives and electric utilities may use our microturbines as a stand-alone system to provide temporary or back-up power for specific applications or to provide primary power for remote needs.

While Capstone MicroTurbines have been deployed solely for the power reliability applications noted above, the highest economic benefits come from combining CHP or CCHP applications with the customer's need for secure power using a Dual-Mode microturbine. Our Dual-Mode microturbines are able to operate connected to a utility grid, but can switch over to stand-alone operation in less than 10 seconds. This provides end users with a backup system with a short return on investment. About half of our microturbine sales are the Dual-Mode versions.

The ability of our microturbines to use a location's fuel of choice, including, for example, kerosene, diesel or propane, allows customers to use their available fuel source infrastructure more efficiently. We also have designed our microturbines to be a competitive primary power source alternative compared to diesel generators and other technologies that currently provide power to remote areas or areas with unreliable central generation. This is due to our microturbines' load following characteristic, which means that our microturbines are able to match power output to the served facility's need for power. Remote commercial and industrial applications, including oil and gas, can also benefit from use of our microturbines. The less frequent scheduled maintenance intervals mean fewer trips are required to provide routine maintenance to remotely located units, and the remote management and monitoring functions provide greater ease of interface with the units.

Capstone MicroTurbine Benefits

Multi-Fuel Capability

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

The Capstone MicroTurbine design provides flexibility for use with a variety of possible fuels, including both gaseous and liquid fuels. This multi-fuel capability increases the number of applications and geographic locations in which our microturbines may be used. The Model C30 is currently capable of being configured for low pressure natural gas, high pressure natural gas, low BTU gas such as methane, high sulfur content (sour) gas, gaseous propane and compressed natural gas, as well as liquid fuels such as diesel, bio-diesel and kerosene. Our Model C60 currently uses natural gas, low BTU gas such as methane from landfills or digesters, sour gas up to 800ppm H₂S, and gaseous propane.

Cost Competitive

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

We believe our microturbines have the potential to be cost competitive in our target markets. The value proposition for our microturbine depends upon a variety of cost elements, including capital cost of the microturbine itself, the cost to engineer and install a complete system at a user's facility, expected maintenance costs over the life of the project, fuel costs, the type of application, the value of the microturbine's electrical output, and other costs that may be offset by deploying a given

7

microturbine solution. The Capstone MicroTurbine value proposition must then be compared with other competing solutions, such as reciprocating engine generators or fuel cells.

One of our best value propositions is CHP. We have experienced examples of customer return on investment in less than five years, with many facilities falling below three years. The United States Energy Policy Act of 2005 includes a 10% investment tax credit for microturbines, providing future advantage for our product. Recently published data for the California self-generation incentive program indicate that microturbines are the preferred technology for installations below 200 kilowatts. With continued product cost reduction and more standardized and less costly installations, we believe that the Capstone value proposition will improve.

In the exploration and production markets, environmental penalties incurred for flaring or venting gas can be avoided by using our microturbines. Our microturbines can burn wellhead gas directly off the casing head, avoiding any intermediary sulfur scrubbing devices, while competing devices require extra maintenance and additional intermediary devices. In the landfill gas digestion market, the microturbine can burn low BTU and sour gas while requiring minimal routine maintenance relative to competing technologies such as reciprocating engines. The ability of the microturbine to provide onsite or distributed power generation allows for less capital expenditures compared to the electric utility grid, which requires up-front capital expenditures for additional distribution and transmission lines.

Environmentally Friendly

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

In stationary power generation configurations, our digitally controlled combustion system produces less than nine parts per million per volume of emissions of NOx and unburned hydrocarbons at full power when burning natural gas, and less than 35 parts per million per volume of emissions of NOx when using diesel fuel. We believe that these emissions levels are among the lowest emissions of any fossil fuel combustor without catalytic combustion or other emissions reduction equipment, which results in a high quality exhaust. Because of our patented air-bearing technology, our microturbines require no petroleum-based lubricants, and avoid potential ground contamination caused by petroleum-based lubricants used by conventional reciprocating engines, turbines and other microturbines. Because our system is air cooled, we avoid the use of toxic liquid coolants, such as glycol.

Availability and Reliability

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

Our microturbines can provide both high availability and reliability when compared to other power generation alternatives. We designed the microturbine for a minimum target availability of 99%. Certain of our microturbines have achieved this availability target when using high-pressure natural gas, and we are working to achieve this availability target across all of our units and for other fuel sources. Some Capstone customers have started our microturbines, set them for full power output 24 hours a day for an entire year, and only shut down at the end of the year for scheduled maintenance to change the filters.

Minimal Scheduled Maintenance

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

Our patented air-bearing system, solid state electronic controls and air-cooled design reduce the scheduled maintenance cost of our microturbines as compared to alternative products. The air bearings eliminate the need for liquid lubrication, avoiding the need to change oil and individually lubricate ball bearings or other similar devices. Our product's ability to continuously and remotely monitor our microturbine performance avoids regularly scheduled diagnostic maintenance costs. The air-cooled design eliminates all of the maintenance related to liquid cooling systems utilized with conventional power electronics technology and generator cooling. Currently, the scheduled maintenance interval for both the Model C30 and C60 is periodic cleaning or changing of the intake air filter, fuel filters and other consumable items every 8,000 hours of operation, with maintenance intervals dependent upon operation, environment, duty cycle and other operational variables.

Remote Monitoring and Operating

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

Our electronic controls allow users to efficiently monitor our microturbines' performance, power generation and time of operation in the field from off-site locations. In addition, the operator can remotely turn the microturbine on and off, control the fuel flow and vary the power output.

Flexible Configuration

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

Our microturbines can be customized to serve a wide variety of operating requirements. They can be connected to the electric utility grid or operate on a stand-alone or dual mode basis. They can use a variety of fuel sources and can be readily integrated into combined heating and power applications. The microturbine can be sold either as a ready-to-use unit or in

8

component and subassembly form for repackaging to the ultimate end-user. The microturbine can be operated as a single unit or several units can be installed together and operated in parallel.

Scalable Power System

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

Our microturbines are designed to allow multiple units to run together to meet each customer's specific needs. This feature enables users to meet more precisely their growing demand requirements and thereby manage their capital costs more efficiently. All of the synchronizing and load sharing capabilities are built into our digital control system, thereby eliminating the cost and space for traditional external equipment to provide these functions.

Relative Ease of Transportation and Minimal Site Requirements

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

Our microturbines are easy to transport and relocate. Their small size allows great flexibility in siting. Our stationary systems in enclosures are approximately six feet tall and weigh between 900 and 3,000 pounds, depending upon model and optional equipment. Our microturbines require a fuel source connection, a connection for the power generated, and proper venting or utilization of exhaust. Larger multipack microturbine configurations may require concrete pads to support the additional weight, but the connections are similar.

Protective Relay Functionality

Our microturbines have protective relay functions built into them such that in grid-connect mode, the microturbine will not send power out over the electric utility grid if the utility is not supplying voltage. This circuit protection function minimizes the potential damage to the local electric grid, which is one of the electric utilities' major concerns about the interconnection of distributed generation technologies. The microturbines have similar built-in protective relay functions to protect against faulty conditions when operating in stand-alone mode.

Sales, Marketing and Distribution

We sell microturbines in the worldwide stationary markets. We anticipate that our microturbines will be used in a variety of stationary power applications requiring less than three megawatts and more immediately in those requiring less than 500 kilowatts.

We sell our products through distributors and dealers, and in some areas of the United States, we sell our products directly. Our parts are sold to distributors, ASCs and to end users. Our typical terms of sale include shipments of the products with title, care, custody and control transferring at our dock, payment due anywhere from in advance of shipment to 90 days from shipment, and warranty periods of approximately 15 to 18 months from shipment. We typically do not have customer acceptance provisions in our agreements.

Sales by Geographical Location

North America

We have distribution agreements with a number of companies throughout North America for the resale of our products. Many of these distributors serve multiple markets in their select geographic regions. The primary markets served in this region have been CHP and resource recovery.

In addition to our distributors, we are initiating actions to expand our presence in our targeted markets by utilizing dealers, manufacturer s representatives and packagers as well as direct sales in selected markets in North America.

In developing our sales opportunities we have identified the need to address various requirements present in our target localities. These requirements include electric grid interconnection standards, gas utility connection requirements, building and fire safety codes and various inspections and approvals. The costs and schedule ramifications of these various approvals can be significant to the completion of an installation. Our goal is to work with the applicable regulating entities to establish compliant standards for the installation of our microturbines so that the costs and installation timelines are minimized for our customers. To date, we have received pre-approval by the New York State Public Services Commission for installation and interconnection to the electric utilities in New York, and we meet the California interconnection requirements. We believe that we can create market advantages for our products through enhancing the ease of deploying our distributed generation solutions.

Asia

Our sales and marketing strategy in Asia has been to develop several distributor relationships in Japan and subsequently enter other selected markets along the Pacific Rim.

Our primary market focus in Japan is CHP applications. Within Japan, there is great demand for economic energy solutions that will lower both the existing high cost of electricity and meet the greenhouse gas emissions guidelines of the Kyoto accords. Our Japanese distributors recognize the quickest and most practical way to accomplish this is through CHP applications, which raise efficiencies from approximately 30% for pure electrical generation to approximately 70% or more. Our Japanese distributors mainly act as packagers. They seek to design applications using our microturbines and/or subassemblies and components for their particular target CHP market, as well as the free fuel biogas market. The Japanese market tends to prefer systems that burn liquid fuels because of the lower costs and greater availability of the fuel.

Other areas in Asia and the Pacific Rim offer attractive opportunities as well. South Korea and China are areas where resource recovery applications and CHP and CCHP solutions are expected to experience market growth.

Europe and Russia

To address the European market, including Russia, we are strengthening our relationship with existing distributors and supporting them and, expanding our distribution base by placing direct sales and service resources in the region. We have an office in Europe for the purpose of working with our distributors there on a daily basis to realize growth opportunities. We have established a spare parts distribution center in Europe to make parts readily available to our distributors. Resource recovery applications have been growing in Europe based on attractive incentives established in several countries. Further, Europe has a history of extensive use of distributed generation technologies.

Revenue

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

For geographic and segment revenue information, please see Notes to Consolidated Financial Statements Segment Reporting.

Customers

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

Two customers accounted for 16% and 12% of net revenue for the year ended March 31, 2007, respectively. Sales to Banking Production Centre accounted for 16%, 10% and 7% of our net revenue for the years ended March 31, 2007, 2006 and 2005, respectively. Sales to United Technologies Corporation (UTC) accounted for 12%, 17% and 15% of our net revenue for the years ended March 31, 2007, 2006 and 2005, respectively. As of March 31, 2007, UTC represented 19%, Banking Production Centre represented 15% and one other customer represented 11% of gross accounts receivable, respectively. To date, we have sold to a relatively few number of customers and have limited repeat business.

Competition

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

The market for our products is highly competitive and is changing rapidly. Our microturbines compete with existing technologies such as reciprocating engines and may also compete with emerging distributed generation technologies, including solar power, wind powered systems, fuel cells and other microturbines. Many companies who could be our customers today rely on the utility grid for their electrical power. As many of our distributed generation competitors are large, well-established companies, they derive advantages from production economies of scale, worldwide presence and greater resources, which they can devote to product development or promotion.

Generally, power purchased from the electric utility grid is less costly than power produced by distributed generation technologies, such as fuel cells or microturbines. Utilities may also charge fees to interconnect to their power grids. However, we can provide economic benefits to end users in instances where the waste heat from our microturbine has value (CHP and CCHP), where fuel costs are low (resource recovery/renewable fuels), where the costs of connecting to the grid from locations are high, where reliability and power quality are of critical importance, or in situations where peak shaving could be economically advantageous because of highly variable electricity prices. Because the Capstone MicroTurbine can provide a reliable source of power and can operate on multiple fuel sources, we believe it offers a level of flexibility not currently offered by other current technologies such as reciprocating engines.

Our competitors that produce reciprocating engines have products and markets that are well developed and technologies that have been proven for some time. A reciprocating engine is similar in design to an internal combustion engine used in automobiles. Reciprocating engines are popular for primary and back-up power applications despite higher levels of emissions, noise and maintenance. These technologies, which typically have a lower up-front cost than microturbines, are currently produced by, among others, Caterpillar, Cummins, Waukesha, GE Jenbacher, Deutz and Kohler.

Our microturbines may also compete with other distributed generation technologies, including solar power and wind-powered systems. Solar powered and wind powered systems produce no emissions. The main drawbacks to solar powered and wind powered systems are their dependence on weather conditions and high capital costs.

Although the market for fuel cells is still developing, a number of companies are focused on the residential and vehicle fuel cell markets, including FuelCell Energy, UTC Power, Plug Power and Ballard Power Systems. Fuel cells have lower levels of NOx atmospheric emissions than our microturbines. We believe that none of these fuel cell technologies will compete directly with our microturbines in the short-term. However, over the medium-to-long term, fuel cell technologies that compete directly with our products may be introduced.

We also compete with several companies who have microturbine products, many of which have significantly greater resources and market presence than us, including Ingersoll-Rand, Elliott Energy Systems and Toyota.

Overall, we compete with end users' other options for electrical power and heat generation on the basis of the ability of our microturbines to provide power when utility grid power is not available or goes out of service, total cost of ownership, power quality, the ability to run certain of our microturbines on multiple fuel types and ease of maintenance.

Governmental and Regulatory Impact

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

Our markets can be positively or negatively impacted by the effects of governmental and regulatory matters. We are affected not only by energy policy, laws, regulations and incentives of governments in the markets into which we sell, but also by rules, regulations and costs imposed by utilities. Utility companies or governmental entities could place barriers on the installation of our product or the interconnection of the product with the electric grid. Further, they may charge additional fees to customers who install on-site power generation, thereby reducing the electricity they take from the utility, or for having the capacity to use power from the grid for back-up or standby purposes. These types of restrictions, fees or charges could hamper the ability to install or effectively use our product or increase the cost to our potential customers for using our systems. This could make our systems less desirable, thereby adversely affecting our revenue and profitability potential. In addition, utility rate reductions can make our products less competitive which would have a material adverse effect on our operations. These costs, incentives and rules are not always the same as those faced by technologies with which we compete. However, rules, regulations, laws and incentives could also provide an advantage to our distributed generation solutions as compared with competing technologies if we are able to achieve required compliance in a lower cost, more efficient manner. Additionally, reduced emissions and higher fuel efficiency could help our customers combat the effects of global warming. Accordingly, we may benefit from increased government regulations that impose tighter emission and fuel efficiency standards.

Government funding can impact the rate of development of new technologies. While we have, and continue to receive some development funding, committed amounts remaining are relatively low. See Research and Development. Competing new technologies generally receive larger incentives and development funding than do microturbines.

Sourcing and Manufacturing

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

Our microturbines are designed to achieve high volume, low-cost production objectives. Our manufacturing designs include the use of conventional technology, which has been proven in high volume automotive and turbocharger production for many years. The microturbines are designed for simple assembly and testing and to facilitate automated production techniques using less-skilled labor.

Our strategy of out-sourcing the manufacturing and assembly of our nonproprietary product components allows for more attractive pricing, quick ramp-up and the use of just-in-time inventory management techniques. While the current variability in our demand volumes and resulting imprecise demand forecasting affect our ability to leverage these capabilities, we believe that we can realize economies of scale related to our product manufacturing costs as unit volume increases. We manufacture the air-bearings and certain combustion system components at our facility in Chatsworth, California. We also assemble and test the units at that location. We manufacture recuperator cores at our facility in Van Nuys, California. We have primary and secondary sources for other critical components. We have evaluated our core competencies and identified additional outsourcing opportunities which we are now actively pursuing.

Although many of the components and subassemblies included in our system products are standard products, a significant portion of the mechanical parts and subassemblies are custom made by a small number of suppliers. In addition, we obtain a significant portion of our component parts from a limited number of suppliers. Some of the subcomponents that make up the components and subassemblies supplied to us are provided to our suppliers only from single sources. We monitor those parts subject to a single or a limited source supply to minimize factory down time due to unavailability of such parts, which could impact our ability to meet manufacturing schedules.

Solar Turbines Incorporated, a wholly owned subsidiary of Caterpillar Inc., had been our sole supplier of recuperator cores prior to 2001. In 2000, we exercised an option to license Solar's technology, which allows us to manufacture cores ourselves. In June 2001, we started to manufacture recuperator cores. Recuperator cores using the Solar technology, which we

make and sell, are subject to a per-unit royalty fee. As of March 31, 2007, cumulative royalties of \$0.1 million have been paid under the terms of the agreement.

Research and Development (R&D)

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

For fiscal years ended March 31, 2007, 2006 and 2005, R&D expense was \$9.4 million, \$11.0 million, and \$11.8 million and was 45%, 46% and 69% of total revenue, respectively. Our R&D activities enabled us to become one of the first companies to develop a commercially available microturbine that operates in parallel with the grid. We were the first company to successfully demonstrate a commercially available microturbine that operates on a stand-alone basis.

The Advanced Power Server is Capstone's latest product aimed at providing customers a complete distributed generation solution. A number of built-in dispatch algorithms have been developed in this latest design for starting/stopping and adjusting the power output of multiple microturbine systems. A common interface to building management systems is provided using commercial off-the-shelf Programmable Logic Controller devices. This new Advanced Power Server (APS) provides customers an integrated solution for dispatching microturbines and monitoring or controlling other balance of plant equipment.

Our 65-kilowatt MicroTurbine systems are the first microturbines to be certified by Underwriters Laboratories Inc. (UL) to the latest UL 1741 interconnection standards that became effective May 7, 2007. The UL 1741 standard, Inverters, Converters, Controllers, and Interconnection Systems for use with Distributed Energy Resources was revised on November 7, 2005 to incorporate the July 2005 revision of the international standard IEEE 1547.1 Standard Conformance Test Procedures for Equipment Interconnecting Distributed Resources with Electric Power Systems. To comply with the new standard, a rigorous battery of tests was conducted to ensure that the Capstone inverter technology meets power quality, protective relay, lightning strike and safety requirements. Statewide utility interconnection requirements, including California Rule 21 and New York State Public Service Commission rules, have adopted the UL 1741 standard. The UL 1741 standard facilitates customer installation of Capstone MicroTurbines in targeted regions such as California and New York.

California emissions standards for distributed generation equipment changed January 1, 2007 to the new CARB 2007 emissions standard. Certification to this standard allows generators to be installed in most of the major air quality management districts in California without regular on-site emissions testing. To date, only microturbines and fuel cells have been certified to this new standard which requires extremely low emissions levels for distributed generation equipment. Capstone enhanced its C65 microturbine to meet CARB 2007 with co-funding from the Department of Energy (DOE). We have completed third party testing and are in the process of submitting the necessary documents to CARB for final approval.

Our most recent significant R&D activity has been the C200 microturbine—a 200-kilowatt, higher efficiency product. We worked with the Department of Energy on its Advanced Microturbine System program and received funding for some of the associated development efforts for the C200. To date, the C200 beta testing has demonstrated performance to design objectives with reliability. We are in discussion with several potential partners to provide additional funding and/or development support to complete the commercialization of the C200.

As a result of our planning efforts, we have developed a prioritized list of new and enhanced products to be developed and released to the market. These products will provide new solutions to customers in selected markets and new technologies that we believe will maintain Capstone's leadership role in the industry.

R&D activities have historically also focused on development of related products and applications, including gas compressors that enhance the microturbines' multi-fuel capability and integration with energy storage devices like battery packs for stand-alone applications. Current and future development activities will be in support of our focused target markets.

Protecting our Intellectual Property Rights and Patents

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

We rely on a combination of patent, trade secret, copyright and trademark law and nondisclosure agreements to establish and protect our intellectual property rights in our products. In this regard, we have obtained 95 U.S. and 26 international patents (in certain cases covering the same technology in multiple jurisdictions). The patents we have obtained will expire between 2014 and 2024.

We believe that a policy of protecting intellectual property is an important component of our strategy of being the leader in microturbine system technology and will provide us with a long-term competitive advantage. In addition, we implement security procedures at our plants and facilities and have confidentiality agreements with our suppliers, distributors, employees and certain visitors to our facilities.

Organization and Employees

We were organized in 1988. On June 22, 2000, we reincorporated as a Delaware corporation.

12

As of March 31, 2007 we employed 195 employees. No employees are covered by collective bargaining arrangements. We consider relations with our employees to be good.

Available Information

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

This annual report on Form 10-K (Annual Report), as well as the Capstone Turbine Corporation s (the Company or Capstone) quarterly reports on Form 10-Q, current reports on Form 8-K, amendments to those reports and proxy statements are made available free of charge on the Company s Internet website (<http://www.microturbine.com>) as soon as reasonably practicable after such materials are electronically filed with or furnished to the Securities and Exchange Commission (SEC). Such material may also be read and copied at the SEC s Public Reference Room at 100 F Street, NE, Washington, DC 20549. Information on the operation of the Public Reference Room may be obtained by calling the SEC at 1-800-SEC-0330. The SEC also maintains an Internet web site (<http://www.sec.gov>) that contains reports, proxy and information statements, and other information regarding issuers that file electronically with the SEC.

13

Item 1A. Risk Factors.

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

This document contains certain forward-looking statements (as such term is defined in Section 27A of the Securities Act of 1933, as amended (the Securities Act) and Section 21E of the Securities Exchange Act of 1934, as amended (the Exchange Act) pertaining to, among other things, our future results of operations, profits and losses, R&D activities, sales expectations, our ability to develop markets for our products, sources for parts, federal, state and local regulations, general business, industry and economic conditions applicable to us, the reliability of our products and their need for maintenance, our ability to be cost-competitive and to outperform competition, customer satisfaction, the value of using our products, our ability to achieve economies of scale, market advantage, return on investment and functionality of products, including the potential use for emergency elevator power. These statements are based largely on our current expectations, estimates and forecasts and are subject to a number of risks and uncertainties. Actual results could differ materially from those anticipated by these forward-looking statements. Factors that can cause actual results to differ materially include, but are not limited to, those discussed below. Readers are cautioned not to place undue reliance on these forward-looking statements, which speak only as of the date hereof. The following factors should be considered in addition to the other information contained herein in evaluating Capstone and its business. We assume no obligation to update any of the forward-looking statements after the filing of this Form 10-K to conform such statements to actual results or to changes in our expectations, except as may be required by law.

The following are risk factors that could affect our business, financial condition, results of operations, and cash flows. These risk factors should be considered in connection with evaluating the forward-looking statements contained in this Annual Report on Form 10 K because these factors could cause the actual results and conditions to differ materially from those projected in forward-looking statements. Before you invest in our publicly traded securities, you should know that making such an investment involves some risks, including the risks described below. Additional risks of which we may not be aware or that we currently believe are immaterial may also impair our business operations or our stock price if any of the risks actually occur, our business, financial condition or results of operations could be negatively affected. In that case, the trading price of our common stock could decline, and you may lose all or part of your investment. In assessing these risks, investors should also refer to the other information contained or incorporated by reference in this report on Form 10-K, our quarterly reports on Form 10-Q and other documents filed by us from time to time.

Our operating history is characterized by net losses. We anticipate further losses and we may never become profitable.

Since inception, we have incurred annual operating losses. We expect this trend to continue until such time that we can sell a sufficient number of units and achieve a cost structure to become profitable. Our business is such that we have relatively few customers and limited repeat business. As a result, we may not maintain or increase net revenue. We may not have adequate cash resources to reach the point of profitability, and we may never become profitable. Even if we do achieve profitability, we may be unable to increase our sales and sustain or increase our profitability in the future.

A sustainable market for microturbines may never develop or may take longer to develop than we anticipate, which would adversely affect our revenue and profitability.

Our products represent an emerging market, and we do not know whether our targeted customers will accept our technology or will purchase our products in sufficient quantities to allow our business to grow. To succeed, demand for our products must increase significantly in existing markets, and there must be strong demand for products that we introduce in the future. If a sustainable market fails to develop or develops more slowly than we anticipate, we may be unable to recover the losses we have incurred to develop our products, we may have further impairment of assets, and we may be unable to meet our operational expenses. The development of a sustainable market for our systems may be hindered by many factors, including some that are out of our control. Examples include:

- consumer reluctance to try a new product;
- regulatory requirements;
- the cost competitiveness of our microturbines;
- costs associated with the installation and commissioning of our microturbines;
- maintenance and repair costs associated with our microturbines;
- the future costs and availability of fuels used by our microturbines;
- economic downturns and reduction in capital spending;
- consumer perceptions of our microturbines safety and quality;

- the emergence of newer, more competitive technologies and products; and
- decrease in domestic and international incentives.

14

We operate in a highly competitive market among competitors who have significantly greater resources than we have and we may not be able to compete effectively.

Capstone microturbines compete with several technologies, including reciprocating engines, fuel cells and solar power. Competing technologies may receive certain benefits, like governmental subsidies or promotion, or be able to offer consumer rebates or other incentives that we cannot receive or offer to the same extent. This could enhance our competitors' abilities to fund research, penetrate markets or increase sales.

Our competitors include several well-known companies with histories of providing power solutions. They have substantially greater resources than we have and have established worldwide presence. Because of greater resources, some of our competitors may be able to adapt more quickly to new or emerging technologies and changes in customer requirements, to devote greater resources to the promotion and sale of their products than we can or they may introduce governmental regulations and policies to create competitive advantage vis-à-vis our products. We believe that developing and maintaining a competitive advantage will require continued investment by us in product development and quality, as well as attention to product performance, our product prices, our conformance to industry standards, manufacturing capability and sales and marketing. In addition, current and potential competitors have established or may in the future establish collaborative relationships among themselves or with third parties, including third parties with whom we have business relationships. Accordingly, new competitors or alliances may emerge and rapidly acquire significant market share.

Overall, the market for our products is highly competitive and is changing rapidly. We believe that the primary competitive factors affecting the market for our products, including some that are outside of our control, include:

- name recognition, historical performance and market power of our competitors;
- product quality and performance;
- operating efficiency;
- product price;
- availability, price and compatibility of fuel;
- development of new products and features; and
- emissions levels.

There is no assurance that we will be able to successfully compete against either current or potential competitors or that competition will not have a material adverse effect on our business, operating results and financial condition.

If we do not effectively implement our sales, marketing and service plans, our sales will not grow and our profitability will suffer.

Our sales and marketing efforts may not achieve intended results and therefore may not generate the net revenue we anticipate. As a result of our corporate strategies, we have decided to focus our resources on selected vertical markets, such as cogeneration (CHP and CCHP), resource recovery and secure power. We may change our focus to other markets or applications in the future. There can be no assurance that our focus or our near term plans will be successful. If we are not able to successfully address markets for our products, we may not be able to grow our business, compete effectively or achieve profitability.

We have begun offering direct sales and service in selected markets. We do not have extensive experience in providing direct sales and service and may not be successful in executing this strategy. In addition, we may lose existing distributors or service providers or we may have more difficulty attracting new distributors and service providers as a result of this strategy. Further we may incur new types of obligations, such as extended service obligations, that could result in costs that exceed the related revenue. We may encounter new transaction types through providing direct sales and service and these transactions may require changes to our historic business practices. For example, an arrangement with a third party leasing company may require us to provide a residual value guarantee, which is not consistent with our past operating practice.

Also, as we expand in international markets, customers may have difficulty or be unable to integrate our products into their existing systems or may have difficulty complying with foreign regulatory and commercial requirements. As a result, our products may require redesign. Any redesign of the product may delay sales or cause quality issues. In addition, we may be

subject to a variety of other risks associated with international business, including import/export restrictions, fluctuations in currency exchange rates and global political and economic instability.

Approval of the New York City Department of Buildings Materials Equipment Acceptance (MEA) application for listing our product on the MEA Index may not result in an increase in sales.

Our sales efforts may not achieve our intended targets with regards to the New York market and, therefore, may not generate the net revenue we anticipate. As a result of our corporate strategies, we decided to focus resources on the New York market to support the sales that may result from the approval of the New York City Department of Buildings MEA application for listing our product on the MEA Index. Though we received our MEA approval from the New York City Department of Buildings MEA Division and the New York Fire Department on May 24, 2006, certain applications of our products will require further approval and there can be no assurance that our focus on, or our near-term plans for the New York market will be successful.

Approval of Capstone-branded products for listing on the General Service Administration (GSA) Schedule does not ensure that we will supply products to the federal government and may not result in an increase in sales.

We have publicly announced that our products have been approved by the GSA. The GSA approval provides the opportunity for federal end-user customers to negotiate and acquire products and services from commercial suppliers. There is no assurance that we will achieve our intended targets with regards to the sale of our products to the federal government, and, therefore, we may not generate the net revenue we anticipate.

We do not have a definitive agreement with Broad USA, Inc. to develop jointly fully integrated cogeneration (CCHP) systems, and this relationship is subject to negotiation and execution of a definitive agreement and may not result in an increase in sales.

We have publicly announced that we have negotiated and signed a Memorandum of Understanding (MOU) with Broad USA, Inc. to jointly develop fully integrated cogeneration (CCHP) systems. The basis of the agreement will synchronize the two companies' products to follow a standardization of on-site power and CCHP solutions. We do not have a definitive agreement with Broad USA, Inc., and no assurance can be given that we will reach such an agreement. If we enter into such an agreement, our sales efforts may not achieve intended targets with regards to the anticipated relationship with Broad USA, Inc. and therefore may not generate the net revenue we anticipate.

We may not be able to retain or develop OEMs, distributors or dealers in our targeted markets, in which case our sales would not increase as expected.

In order to serve certain of our targeted markets, we believe that we must ally ourselves with companies that have particular expertise or better access to those markets. We believe that retaining or developing strong OEMs, distributors or dealers in these targeted markets can improve the rate of adoption as well as reduce the direct financial burden of introducing a new technology and creating a new market. Because of OEMs', distributors' and dealers' relationships in their respective markets, the loss of a OEM, distributor or dealer could adversely impact the ability to penetrate our target market. We offer our OEMs, distributors and dealers a stated discount from list price for the products they purchase. In the future, to attract and retain OEMs, distributors and dealers, we may provide volume price discounts or otherwise incur significant costs that may reduce the potential profitability of these relationships. We may not be able to retain or develop appropriate OEMs, distributors or dealers on a timely basis, and we cannot provide assurance that the OEMs, distributors or dealers will focus adequate resources on selling our products or will be successful in selling them. In addition, some of the relationships may require that we grant exclusive distribution rights in defined territories. These exclusive distribution arrangements could result in our being unable to enter into other arrangements at a time when the OEM, distributor or dealer with whom we form a relationship is not successful in selling our products or has reduced its commitment to market our products. We cannot provide assurance that we will be able to negotiate collaborative relationships on favorable terms or at all. The inability of the Company to have appropriate distribution in our target markets may adversely affect our financial condition and results of operations.

A significant customer may not achieve its forecasted sales growth, and we gave it notice of certain breaches of contract that have not been cured and could result in termination of our agreement with this customer.

Sales to UTC Power, LLC (UTCP), an affiliate of United Technologies Corporation, accounted for approximately 12% and 17% of our net revenue for the years ended March 31, 2007 and 2006. Our OEM agreement with UTCP permits UTCP to

package the Capstone microturbine products with chillers and heat exchange equipment manufactured by UTCP and to sell and service the integrated CCHP units. UTCP's performance as it relates to engineering, installation and provision of after-market service could have a significant impact on our reputation and products. On September 11, 2005, we gave notice to UTCP, pursuant to our OEM agreement, of certain breaches of the OEM agreement by UTCP, including failure to meet sales targets for the year. With respect to most of the breaches, UTCP had ninety (90) calendar days following its receipt of the notice in which to cure the breaches. We could elect to terminate the OEM agreement if UTCP fails to cure the breaches. While we believe that UTCP has not yet cured some key breaches of the agreement, we have continued to work with UTCP and have encouraged UTCP to resolve the underlying causes of the breaches. Meanwhile, we are continuing to do business with UTCP under the OEM agreement, and we have not terminated the agreement. If this relationship is terminated, we will honor sales orders committed to prior to the date of termination in accordance with the OEM agreement; however, our near-term sales, cash flow and profitability could be adversely affected. Furthermore, while this relationship is important to us, UTCP has not and may not achieve its forecasted sales growth, which could affect our ability to meet our sales, cash flow and profitability targets.

We may not be able to develop sufficiently trained applications engineering, installation and service support to serve our targeted markets.

Our ability to identify and develop business relationships with companies who can provide quality, cost-effective application engineering, installations and service can significantly affect our success. The application engineering and proper installation of our microturbines, as well as proper maintenance and service, are critical to the performance of the units. Additionally, we need to reduce the total installed cost of our microturbines to enhance market opportunities. Our inability to improve the quality of applications, installation and service while reducing associated costs could affect the marketability of our products.

Changes in our product components may require us to replace parts held at distributors and ASCs.

We have entered into agreements with some of our distributors and ASCs that require that if we render parts obsolete in inventories they own and hold in support of their obligations to serve fielded microturbines, then we are required to replace the affected stock at no cost to the distributors or ASCs. It is possible that future changes in our product technology could involve costs that have a material adverse effect on our results of operations or financial position.

We operate in a highly regulated business environment, and changes in regulation could impose significant costs on us or make our products less economical, thereby affecting demand for our microturbines.

Our products are subject to federal, state, local and foreign laws and regulations, governing, among other things, emissions to air and occupational health and safety. Regulatory agencies may impose special requirements for the implementation and operation of our products or that may significantly affect or even eliminate some of our target markets. We may incur material costs or liabilities in complying with government regulations. In addition, potentially significant expenditures could be required in order to comply with evolving environmental and health and safety laws, regulations and requirements that may be adopted or imposed in the future. For example, the California Air Resources Board (CARB) has recently determined that the CARB 2007 standards are applicable to microturbines as of January 1, 2007. We have not yet been able to achieve compliance with these new standards. Until we are able to produce microturbines in compliance with these standards our customers in certain parts of California would have to receive air emission permits before installation of a Capstone microturbine. In addition, the addressable market will be reduced in certain parts of California as customers will not be allowed to apply for air emissions permits to install a Capstone microturbine. This will have an effect on installations and add incremental cost to the customer. Furthermore, our potential utility customers must comply with numerous laws and regulations. The deregulation of the utility industry may also create challenges for our marketing efforts. For example, as part of electric utility deregulation, federal, state and local governmental authorities may impose transitional charges or exit fees, which would make it less economical for some potential customers to switch to our products. We can provide no assurances that we will be able to obtain these approvals and changes in a timely manner, or at all. There is no assurance that we will achieve compliance with the new standards. Non-compliance with the new standards could have a material adverse effect on our operating results.

The market for electricity and generation products is heavily influenced by federal and state government regulations and policies. The deregulation and restructuring of the electric industry in the United States and elsewhere may cause rule changes that may reduce or eliminate some of the advantages of such deregulation and restructuring. We cannot determine how any deregulation or restructuring of the electric utility industry may ultimately affect the market for our microturbines.

Changes in regulatory standards or policies could reduce the level of investment in the research and development of alternative power sources, including microturbines. Any reduction or termination of such programs could increase the cost to our potential customers, making our systems less desirable, and thereby adversely affect our revenue and potential profitability.

In addition, the State of California Self-Generation Incentive Program Level 3 (Non-Renewable / Non-Solar) is scheduled to expire in December 2007. If the efforts to extend these credits are not successful, our customers would lose the benefit of these incentives, thus reducing the economic benefits for California customers and depriving them of a significant incentive for purchases of microturbines. Loss of this incentive could cause a material adverse effect on our operating results.

Utility companies or governmental entities could place barriers to our entry into the marketplace, and we may not be able to effectively sell our product.

Utility companies or governmental entities could place barriers on the installation of our product or the interconnection of the product with the electric grid. Further, they may charge additional fees to customers who install on-site generation, or for having the capacity to use power from the grid for back-up or standby purposes. These types of restrictions, fees or charges could hamper the ability to install or effectively use our product or increase the cost to our potential customers for using our systems. This could make our systems less desirable, thereby adversely affecting our revenue and profitability potential. In addition, utility rate reductions can make our products less competitive which would have a material adverse effect on our operations. The cost of electric power generation is ultimately tied to the cost of natural gas. However, changes to electric utility tariffs often require lengthy regulatory approval and include a mix of fuel types as well as customer categories. Potential customers may perceive the resulting swings in gas and electric pricing as an increased risk of investing in on-site generation.

Product quality expectations may not be met causing slower market acceptance or warranty cost exposure.

As we continue to improve the quality and lower the total costs of ownership of our products, we may require engineering changes. Such improvement initiatives may render existing inventories obsolete or excessive. Despite our continuous quality improvement initiatives, we may not meet customer expectations. Any significant quality issues with our products could have a material adverse effect on our rate of product adoption, results of operations and financial condition. Moreover, as we develop new configurations for our microturbines or as our customers place existing configurations in commercial use, our products may perform below expectations. Any significant performance below expectations could adversely affect our operating results and financial condition and affect the marketability of our products.

We sell our products with warranties. There can be no assurance that the provision for estimated product warranty will be sufficient to cover our warranty expenses in the future. We cannot ensure that our efforts to reduce our risk through warranty disclaimers will effectively limit our liability. Any significant incurrence of warranty expense in excess of estimates could have a material adverse effect on our operating results and financial condition. Further, we have at times undertaken programs to enhance the performance of units previously sold. These enhancements have at times been provided at no cost or below our cost. If we choose to offer such programs again in the future, such actions could result in significant costs.

We depend upon the development of new products and enhancements of existing products.

Our operating results depend on our ability to develop and introduce new products, or enhance existing products and to reduce the costs to produce our products. The success of our products is dependent on several factors, including proper product definition, product cost, timely completion and introduction of the products, differentiation of products from those of our competitors, meeting changing customer requirements, emerging industry standards and market acceptance of these products. The development of new, technologically advanced products and enhancements is a complex and uncertain process requiring high levels of innovation, as well as the accurate anticipation of technological and market trends. There can be no assurance that we will successfully identify new product opportunities, develop and bring new or enhanced products to market in a timely manner, successfully lower costs and achieve market acceptance of our products, or that products and technologies developed by others will not render our products or technologies obsolete or noncompetitive.

Operational restructuring may result in asset impairment or other unanticipated charges.

As a result of our corporate strategies, we have identified opportunities to outsource to third party suppliers certain functions which we currently perform. We believe outsourcing can reduce product costs, improve product quality or increase operating efficiency. These actions may not yield the expected results, and outsourcing may result in delay or lower quality products. Transitioning to outsourcing may cause certain affected employees to leave the Company before the outsourcing is

complete. This could result in a lack of the experienced in-house talent necessary to successfully implement the outsourcing. Further, depending on the nature of operations outsourced and the structure of agreements we reach with suppliers to perform these functions, we may experience impairment in the value of manufacturing assets related to the outsourced functions or other unanticipated charges, which could have a material adverse effect on our operating results.

We may not achieve production cost reductions necessary to competitively price our product, which would impair our sales.

We believe that we will need to reduce the unit production cost of our products over time to maintain our ability to offer competitively priced products. Our ability to achieve cost reductions will depend on our ability to develop low cost design enhancements, to obtain necessary tooling and favorable supplier contracts and to increase sales volumes so we can achieve economies of scale. We cannot provide assurance that we will be able to achieve any such production cost reductions. Our failure to achieve such cost reductions could have a material adverse effect on our business and results of operations.

Commodity market factors impact our costs and availability of materials.

Our products contain a number of commodity materials, from metals, which includes steel, special high temperature alloys, copper, nickel and molybdenum, to computer components. The availability of these commodities could impact our ability to acquire the materials necessary to meet our requirements. The cost of metals has historically fluctuated. The pricing could impact the costs to manufacture our product. If we are not able to acquire commodity materials at prices and on terms satisfactory to us or at all, our operating results may be materially adversely affected.

Our suppliers may not supply us with a sufficient amount of components or components of adequate quality, and we may not be able to produce our product.

Some of our components are currently available only from a single source or limited sources. We may experience delays in production if we fail to identify alternative suppliers, or if any parts supply is interrupted, each of which could materially adversely affect our business and operations. In order to reduce manufacturing lead times and ensure adequate component supply, we enter into agreements with certain suppliers that allow them to procure inventories based upon criteria defined by us. If we fail to anticipate customer demand properly, an oversupply of parts could result in excess or obsolete inventories, which could adversely affect our business. Our inability to meet volume commitments with suppliers could affect the availability or pricing of our parts and components. A reduction or interruption in supply, a significant increase in price of one or more components or a decrease in demand of products could materially adversely affect our business and operations and could materially damage our customer relationships. Financial problems of suppliers on whom we rely could limit our supply or increase our costs. Also, we cannot guarantee that any of the parts or components that we purchase will be of adequate quality or that the prices we pay for the parts or components will not increase. Inadequate quality of products from suppliers could interrupt our ability to supply quality products to our customers in a timely manner. Additionally, defects in materials or products supplied by our suppliers that are not identified before our products are placed in service by our customers could result in higher warranty costs and damage to our reputation. We also outsource certain of our components internationally and expect to increase international outsourcing of components. As a result of outsourcing internationally, we may be subject to delays in delivery due to the timing or regulations associated with the import/export process, delays in transportation or regional instability.

Our products involve a lengthy sales cycle and we may not anticipate sales levels appropriately, which could impair our potential profitability.

The sale of our products typically involves a significant commitment of capital by customers, with the attendant delays frequently associated with large capital expenditures. For these and other reasons, the sales cycle associated with our products is typically lengthy and subject to a number of significant risks over which we have little or no control. We expect to plan our production and inventory levels based on internal forecasts of customer demand, which is highly unpredictable and can fluctuate substantially. If sales in any period fall significantly below anticipated levels, our financial condition and results of operations would suffer. If demand in any period increases well above anticipated levels, we may have difficulties in responding, incur greater costs to respond, or be unable to fulfill the demand in sufficient time to retain the order, which would negatively impact our operations. In addition, our operating expenses are based on anticipated sales levels, and a high percentage of our expenses are generally fixed in the short term. As a result of these factors, a small fluctuation in timing of sales can cause operating results to vary from period to period.

Potential intellectual property, shareholder or other litigation may adversely impact our business.

We may face litigation relating to intellectual property matters, labor matters, product liability, or other matters. An adverse judgment could negatively impact our financial position and results of operations, the price of our common stock and our ability to obtain future financing on favorable terms or at all. Any litigation could be costly, divert management attention or result in increased costs of doing business.

We may be unable to fund our future operating requirements, which could force us to curtail our operations.

To the extent that the funds we now have on hand are insufficient to fund our future operating requirements, we would need to raise additional funds, through further public or private equity or debt financings depending upon prevailing market conditions. These financings may not be available or, if available, may be on terms that are not favorable to us and could result in dilution to our stockholders and reduction of the price of our stock. Downturns in worldwide capital markets could also impede our ability to raise additional capital on favorable terms or at all. If adequate capital were not available to us, we would likely be required to significantly curtail or possibly even cease our operations.

We may not be able to effectively manage our growth, expand our production capabilities or improve our operational, financial and management information systems, which would impair our sales and profitability.

If we are successful in executing our business plan, we will experience growth in our business that could place a significant strain on our business operations, management and other resources. Our ability to manage our growth will require us to expand our production capabilities, continue to improve our operational, financial and management information systems, and to motivate and effectively manage our employees. We cannot provide assurance that our systems, procedures and controls or financial resources will be adequate, or that our management will keep pace with this growth. We cannot provide assurance that our management will be able to manage this growth effectively.

Our success depends in significant part upon the continuing service of management and key employees.

Our success depends in significant part upon the continuing service of our executive officers, senior management and sales and technical personnel. The failure of our personnel to execute our strategy, or our failure to retain management and personnel could have a material adverse effect on our business. Our success will be dependent on our continued ability to attract, retain and motivate highly skilled employees. There can be no assurance that we can do so.

Our internal control systems rely on people trained in the execution of the controls. Loss of these people or our inability to replace them with similarly skilled and trained individuals or new processes in a timely manner could adversely impact our internal control mechanisms.

We cannot be certain of the future effectiveness of our internal controls over financial reporting or the impact thereof on our operations or the market price of our common stock.

Pursuant to Section 404 of the Sarbanes-Oxley Act of 2002, we are required to include in our Annual Reports on Form 10-K our assessment of the effectiveness of our internal controls over financial reporting. Furthermore, our independent registered public accounting firm is required to audit our assessment of the effectiveness of our internal controls over financial reporting and separately report on whether it believes we maintain, in all material respects, effective internal controls over financial reporting. We identified three material weaknesses in our system of internal controls as of March 31, 2005.

Since March 31, 2005, we have remediated the three material weaknesses. We cannot provide assurance that our system of internal controls will be effective in the future as our operations and control environment change. If we cannot adequately maintain the effectiveness of our internal controls over financial reporting, our financial reporting may be inaccurate. If reporting errors actually occur, we could be subject to sanctions or investigation by regulatory authorities, such as the Securities and Exchange Commission. These results could adversely affect our financial results or the market price of our common stock.

Our operations are vulnerable to interruption by fire, earthquake and other events beyond our control.

Our operations are vulnerable to interruption by fire, earthquake and other events beyond our control. Our executive offices and manufacturing facilities are located in Southern California. Because the Southern California area is located in an

earthquake-sensitive area, we are particularly susceptible to the risk of damage to, or total destruction of, our facilities in Southern California and the surrounding transportation infrastructure, which could affect our ability to make and transport our products. The Company does not maintain earthquake coverage for personal property or resulting business interruption. If an earthquake, fire or other natural disaster occurs at or near our facilities, our business, financial condition and operating results could be materially adversely affected.

The market price of our common stock has been and may continue to be highly volatile and an investment in our securities could suffer a decline in value.

An investment in our securities is risky, and shareholders could suffer significant losses and wide fluctuations in the market value of their investment. The market price of our common stock is highly volatile and is likely to continue to be volatile. As a result of the factors discussed below, our operating results for a particular quarter are difficult to predict. Given the continued uncertainty surrounding many variables that may affect the industry in which we operate, our ability to foresee results for future periods is limited. This variability could affect our operating results and thereby adversely affect our stock price. Many factors that contribute to this volatility are beyond our control and may cause the market price of our common stock to change, regardless of our operating performance. Factors that could cause fluctuation in our stock price may include, among other things:

- actual or anticipated variations in quarterly operating results;
- market sentiment toward alternate energy stocks in general or toward Capstone;
- changes in financial estimates or recommendations by securities analysts;
- conditions or trends in our industry or the overall economy;
- loss of one or more of our significant customers;
- errors, omissions or failures by third parties in meeting commitments to the Company;
- changes in the market valuations or earnings of our competitors or other technology companies;
- the trading of options on our common stock;
- announcements by us or our competitors of significant acquisitions, strategic partnerships, divestitures, joint ventures or other strategic initiatives;
- announcements of significant market events, such as power outages, regulatory changes or technology changes;
- changes in the estimation of the future size and growth rate of our market;
- future equity financings;
- the failure to achieve our near-term plans for the federal government despite receiving listing on the General Service Administration Schedule;
- the failure to achieve our near-term plans for the New York market despite receiving the New York MEA approval;
- failure to enter into a definitive agreement with Broad USA, Inc.;
- litigation or disputes with customers or business partners;

- capital commitments;
- additions or departures of key personnel;
- sales or purchases of the Company's common stock;
- the trading volume of our common stock;
- developments relating to litigation or governmental investigations; and
- decrease in oil and electricity prices.

In addition, the stock market in general, and the Nasdaq Global Market and the market for technology companies in particular, have experienced extreme price and volume fluctuations that have often been unrelated or disproportionate to the operating performance of particular companies affected. The market prices of securities of technology companies and companies servicing the technology industries have been particularly volatile. These broad market and industry factors may cause a material decline in the market price of our common stock, regardless of our operating performance. In the past, following periods of volatility in the market price of a company's securities, securities class-action litigation has often been instituted against that company. This type of litigation, if instituted against us and regardless of whether we prevail on the

underlying claim, could result in substantial costs and a diversion of management's attention and resources, which could materially harm our financial condition and results of operations.

Provisions in our certificate of incorporation, bylaws and our stockholder rights plan, as well as Delaware law, may discourage, delay or prevent a merger or acquisition at a premium price.

Provisions of our second amended and restated certificate of incorporation, amended and restated bylaws and our stockholder rights plan, as well as provisions of the General Corporation Law of the State of Delaware, could discourage, delay or prevent unsolicited proposals to merge with or acquire us, even though such proposals may be at a premium price or otherwise beneficial to you. These provisions include our board's authorization to issue shares of preferred stock, on terms the board determines in its discretion, without stockholder approval, and provisions of Delaware law that restrict many business combinations.

We are subject to the provisions of Section 203 of the General Corporation Law of the State of Delaware, which could prevent us from engaging in a business combination with a 15% or greater stockholder for a period of three years from the date it acquired such status unless appropriate board or stockholder approvals are obtained. Our board of directors has adopted a stockholder rights plan, pursuant to which one preferred stock purchase right has been issued for each share of our common stock authorized and outstanding at the close of business on July 18, 2005. The rights plan is intended to protect our stockholders in the event of an unfair or coercive offer to acquire the Company. However, the existence of the rights plan may discourage, delay or prevent a merger or acquisition of the Company that is not supported by the board of directors.

Item 1B. Unresolved Staff Comments.

None.

Item 2. Properties.

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

Our principal corporate offices, administrative, sales and marketing, R&D and support facilities consist of approximately 98,000 square feet of leased office space, warehouse space and assembly and test space at 21211 Nordhoff Street in Chatsworth, California. Our lease for those premises expires in May 2010. We also lease an approximately 79,000 square foot facility at 16640 Stagg Street in nearby Van Nuys, California as an engineering test and manufacturing facility for our recuperator cores. This lease will expire in May 2010.

The Company also leases space from CapGen CHP, Inc. in connection with our facility located in Brooklyn, New York. We lease approximately 47,500 square feet of space to accommodate offices, warehousing and manufacturing and light component assembly work. This lease expires in October 2010.

We believe our facilities are adequate for our current needs.

Item 3. Legal Proceedings.

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

In December 2001, a purported shareholder class action lawsuit was filed in the United States District Court for the Southern District of New York (the District Court) against the Company, two of its then officers, and the underwriters of the Company's initial public offering. The suit purports to be a class action filed on behalf of purchasers of the Company's common stock during the period from June 28, 2000 to December 6, 2000. An amended complaint was filed on April 19, 2002. The Plaintiffs allege that the underwriter defendants agreed to allocate stock in the Company's June 28, 2000 initial public offering and November 16, 2000 secondary offering to certain investors in exchange for excessive and undisclosed commissions and agreements by those investors to make additional purchases of stock in the aftermarket at pre-determined prices. The Plaintiffs allege that the prospectuses for these two public offerings were false and misleading in violation of the securities laws because they did not disclose these arrangements. In June 2004, a committee of our Board of Directors approved a proposed partial settlement with the plaintiffs in this matter. The settlement would have provided, among other things, a release of the Company and of the individual defendants for the wrongful conduct alleged in the Amended Complaint in exchange for a guarantee from the Company's insurers regarding recovery from the underwriter defendants and other non-monetary consideration from the Company regarding its underwriters. The Plaintiffs have continued to litigate against the underwriter defendants. The District Court directed that the litigation proceed within a number of focus cases rather than all of the 310 cases that have been consolidated. The Company's case is not one of these focus cases. On October 13, 2004, the District Court certified the focus cases as class actions. The underwriter defendants appealed that ruling, and on December 5, 2006, the Court of Appeals for the Second Circuit reversed the District Court's class certification decision. On April 6, 2007,

the Second Circuit denied the Plaintiffs' petition for rehearing. In light of the Second Circuit opinion, liaison counsel for all issuer defendants, including the Company, informed the District Court that this settlement cannot be approved because the defined settlement class, like the litigation class, cannot be certified. We cannot predict whether we will be able to renegotiate a settlement that complies with the Second Circuit's mandate. Because of the inherent uncertainties of litigation, we cannot accurately predict the ultimate outcome of the matter.

Item 4. Submission of Matters to a Vote of Security Holders.

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

We did not submit any matters to a vote of our stockholders during the fourth quarter of the year ended March 31, 2007.

23

PART II**Item 5. Market for Registrant's Common Equity, Related Stockholder Matters and Issuer Purchases of Equity Securities.***Price Range of Common Stock*

Our common stock is publicly traded on the Nasdaq Global Market under the symbol CPST. The following table sets forth the low and high sales prices for each period indicated.

	High	Low
Year Ended March 31, 2005:		
First Quarter	\$ 3.52	\$ 1.34
Second Quarter	\$ 2.25	\$ 1.42
Third Quarter	\$ 2.10	\$ 1.49
Fourth Quarter	\$ 1.90	\$ 1.49
Year Ended March 31, 2006:		
First Quarter	\$ 1.59	\$ 0.89
Second Quarter	\$ 5.89	\$ 1.25
Third Quarter	\$ 4.50	\$ 2.25
Fourth Quarter	\$ 3.99	\$ 2.96
Year Ended March 31, 2007:		
First Quarter	\$ 4.47	\$ 2.20
Second Quarter	\$ 2.52	\$ 1.24
Third Quarter	\$ 1.75	\$ 1.21
Fourth Quarter	\$ 1.25	\$ 0.75

As of June 6, 2007, the last reported sale price of our common stock on the Nasdaq Global Market was \$1.00 per share.

Stockholders

As of June 6, 2007 there were 957 stockholders of record of our common stock. This does not include the number of persons whose stock is held in nominee or street name accounts through brokers.

Dividend Policy

We currently intend to retain any earnings for use in our business and, therefore, we do not anticipate paying any cash dividends in the foreseeable future. We have never declared or paid any cash dividends on our capital stock. In the future, the decision to pay any cash dividends will depend upon our results of operations, financial condition and capital expenditure plans, as well as such other factors as our Board of Directors, in its sole discretion, may consider relevant.

Recent Sales of Unregistered Securities

None.

Item 6. Selected Financial Data.

The selected financial data shown below have been derived from the audited financial statements of Capstone. The historical results are not necessarily indicative of the operating results to be expected in the future. The selected financial data should be read in conjunction with Risk Factors, Management's Discussion and Analysis of Financial Condition and Results of Operations and the consolidated financial statements and related notes included elsewhere in this Annual Report on Form 10-K. On December 12, 2003, we changed our fiscal year end from December 31 to March 31. As such, selected financial data appears below for the Company's three months transition period of January 1, 2003 to March 31, 2003. The period from April 1, 2003 to March 31, 2004 is referred to herein as Fiscal 2004 and thereafter, the fiscal year designation refers to the twelve-month period ending in March of the stated fiscal year.

Item 7. Management's Discussion and Analysis of Financial Condition and Results of Operations.

The following Management's Discussion and Analysis of Financial Condition and Results of Operations contains forward-looking statements that involve risks and uncertainties. Our actual results may differ materially from the results discussed in the forward-looking statements. Factors that might cause a difference include, but are not limited to, those discussed under Item 1A (Risk Factors) in this Annual Report on Form 10-K. The following section is qualified in its entirety by the more detailed information, including our financial statements and the notes thereto, which appears elsewhere in this Annual Report on Form 10-K.

Overview

Capstone is, and has been, the market leader in microturbines based on the number of microturbines sold. However, the adoption rate for our products has been slower than originally anticipated. We believe that the following key factors contributed to this result: inadequate technology robustness and solution-specific engineering, installation, commissioning and service work; market approach; new technology adoption barriers; Capstone's R&D focused culture and constrained capital spending as a result of the general economic conditions. The performance of our early-generation microturbines was inconsistent. While some units performed as expected, others did not. These performance inconsistencies have been identified as coming from the product itself and from inappropriate application and inadequate installation and service work. Contributing to these challenges, our historical market approach was to emphasize sales volume primarily rather than sales with higher contribution margins. This historical focus on volume introduced high variability in the configurations sold, types of applications, system installations and customer requirements. In addition, new technologies traditionally encounter adoption barriers. An important means to overcome adoption barriers is to fully meet customers' needs and develop groups of customers who provide good references for potential new customers in their specific markets. Capstone's widespread approach to marketing did not provide for depth of referencing in any given market. While these types of challenges are not unusual for new companies, we believe Capstone's historically R&D-focused business structure and culture prohibited us from adequately addressing necessary changes. Capstone is undergoing a period of transition.

Our current management team has approximately sixty years of experience in distributed generation and co-generation with the addition of our new Chief Executive Officer, Executive Vice President of Sales & Marketing and Senior Vice President of Customer Service. This team has successfully sold competing products including GE Jenbacher, Caterpillar, Deutz, Waukesha and other microturbines.

We continue to focus on our customers, learning from them what we need to do to improve our delivery of products and services. We continue to implement the necessary changes to transition from an R&D-focused company and culture to a business that is focused on customers and operational excellence. Engineering projects are approved based on market requirements and decisions to move forward on projects are tied to our financial goals. Our focus is on products and solutions that provide near-term opportunities to drive repeatable business rather than discrete projects for niche markets.

In order to increase volume and reduce cost, we are focusing our efforts in vertical markets that we expect to generate repeat business for the Company. To support our opportunities to grow in these target markets, we continue to enhance the reliability of our products' performance through a multi-faceted approach. We developed new processes and enhanced training to assist those who apply, install and use our products, and we improved the products themselves.

An overview of our direction, targets and key initiatives follows:

1) *Focus on Vertical Markets* Within the distributed generation markets that we serve, we focus on vertical markets that we identify as having the greatest near-term potential. In our primary products and applications (CHP and CCHP, resource recovery and secure power), we identify specific targeted vertical market segments. Within each of these markets, we identify what we believe to be the critical factors to penetrating these markets and have based our plans on those factors.

During Fiscal 2007, we booked orders for 13.5 megawatts and shipped 15.6 megawatts of products, resulting in 5.5 megawatts in backlog at the end of the fiscal year. Our actual product shipments in Fiscal 2007 were: 42% for use in CHP applications, 12% for use in CCHP applications and 37% for use in resource recovery applications. Other markets (including secure power) were 9%.

2) *Sales and Distribution Channel* We seek out distributors, dealers and representatives that have business experience and capabilities to support our growth plans in our targeted markets. In North America, we currently have 16 distributors and 5 dealers. Internationally, outside of North America, we currently have 27 distributors and 2 dealers. We continue to refine the distribution channels to address our specific targeted markets.

- 3) *Geographic Focus* Within the United States, our focus is on California and the Northeast. We use our corporate headquarters to serve the California market and our sales and service office in New York to expand our penetration in the Northeastern market. Based on our belief that the European countries and Russia will offer significant opportunities, we opened a European headquarters office in Milan, Italy in Fiscal 2005 and an office in Nottingham, England in Fiscal 2007. Accordingly, we expect to continue to develop our distribution base and market presence in Europe. In Japan, we are focused on developing niche opportunities that we believe offer the potential for increasing sales volumes over the next three years. Throughout Asia we are focusing resources on increased distribution channels to the market with the expectation that China will become a significant market in the years ahead. Additionally, we have established an office in Mexico.
- 4) *Service* During Fiscal 2005, we entered the direct service business. Previously, our service strategy was to serve all customers through our distributors and ASCs. Distributors were expected to sell the products, provide engineering solutions, and perform as ASCs by providing installation, commissioning and service. Several of our distributors did not provide the level of service desired and a number of end users requested to work directly with us. As a result, we are pursuing a strategy to serve customers directly, as well as through qualified distributors and ASCs, all of whom will perform their service work using technicians specifically trained by Capstone. In Fiscal 2007, we continued to present alternatives to customers under-served by our distributor and ASC base through Capstone factory direct service. Service revenue in Fiscal 2007 was approximately 4% of total revenue. We also intend to establish spare parts distribution centers in strategic locations to ensure timely delivery of parts.
- 5) *Product Robustness and Life Cycle Maintenance Costs* To provide us with the ability to evaluate microturbine performance in the field, we developed a real-time remote monitoring and diagnostic feature. This feature will allow us to monitor installed units and rapidly collect operating data on a continual basis. We will use this information to anticipate and more quickly respond to field performance issues, evaluate component robustness and identify areas for continuous improvement. This feature is important in allowing us to better serve our customers.
- 6) *New Product Development* Our new product development is targeted specifically to meet the needs of our selected vertical markets. We expect that our existing product platforms, the Model C30 and C60 Series, will be our foundational product lines for the foreseeable future. Our product development efforts are centered on enhancing the features of these base products. Our C200 product beta testing was successfully implemented during Fiscal 2005. Testing and engineering continue on strategic areas of the engine.
- 7) *Cost and Core Competencies* We believe that we can achieve overall cost improvements by outsourcing areas not consistent with our core competencies. We have identified design, assembly, test and installation support as areas where we have opportunities to save costs through outsourcing. In conjunction with these changes, we have launched a strategic supply chain initiative to begin developing suppliers in China and other parts of Asia. Although we are only in the early stages of this initiative, we are encouraged by the improved cost opportunities this effort may produce.

We believe that execution in each of these key areas will be necessary to continue Capstone's transition from an R&D focused company with a promising technology and early market leadership to achieving positive cash flow with growing market presence and improving financial performance. Based on the progress we have achieved, we have established a goal to achieve cash flow positive between March and December 2008.

Critical Accounting Policies

Our discussion and analysis of our financial condition and results of operations is based upon our consolidated financial statements, which have been prepared in accordance with accounting principles generally accepted in the United States of America (GAAP). The preparation of these consolidated financial statements requires us to make estimates and judgments that affect the reported amounts of assets, liabilities, revenue and expenses and related disclosures of contingent liabilities. On an on-going basis, we evaluate our estimates, including but not limited to those related to intangible assets, fixed assets, bad debts, inventories, warranty obligations, income taxes, contingencies and litigation. We base our

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

estimates on historical experience and on various other assumptions that we believe to be reasonable under the circumstances, the results of which form the basis for making judgments about the carrying values of assets and liabilities that are not readily apparent from other sources. Actual results may differ from these estimates under different assumptions or conditions.

We believe that the following critical accounting policies affect our more significant judgments and estimates used in the preparation of the consolidated financial statements.

- We review long-lived assets, including intangible assets, for impairment whenever events or changes in circumstances indicate that the carrying amount of an asset may not be recoverable. Our intangible assets consist of a license granted to the Company to use a former supplier's intellectual property repurchased by the Company from a former

27

shareholder. Long-lived assets are being depreciated or amortized over their estimated useful lives. Intangible assets are being amortized over their estimated useful lives. Future write-downs may be required if the value of these assets becomes impaired, and depreciation and amortization may be accelerated if estimated useful lives are shortened. We recorded a \$0.6 million loss in Fiscal 2005 on assets held for sale as of March 31, 2005. We recognized a full impairment loss on marketing rights of \$16.0 million in 2002, and recorded a partial impairment loss of \$5.0 million on fixed assets and the manufacturing license related to our recuperator core facility in 2002. We identify asset groups in accordance with Statement of Financial Accounting Standards (SFAS) No. 144, Accounting for the Impairment or Disposal of Long-Lived Assets and compare the expected future cash flows to be generated from asset groups to the carrying value of the assets. In the event that the future cash flows are insufficient to recover the value of the assets, we write down the asset group to their estimated fair value. While we currently have no indications of events or circumstances that indicate additional impairments are warranted, future changes in our forecast expectations or changes in our utilization of these or other assets may result in further impairment of our long-lived assets.

- Our inventories are valued at lower of cost or market. We routinely evaluate the composition of our inventories and identify slow-moving, excess, obsolete or otherwise impaired inventories. Inventories identified as impaired are evaluated to determine if write-downs are required. Included in this assessment is a review for obsolescence as a result of engineering changes in our product. Future product enhancement and development may render certain inventories obsolete, resulting in additional write-downs of inventories. In addition, inventories are classified as current or long-term based on our sales forecast. A change in forecast could impact the classification of inventories.
- We provide for the estimated cost of warranties at the time revenue from sales is recognized. We also accrue the estimated costs to address reliability repairs on products no longer under warranty when, in our judgment, and in accordance with a specific plan developed by us, it is prudent to provide such repairs. We estimate warranty expenses based upon historical and projected product failure rates, estimated costs of parts, labor and shipping to repair or replace a unit and the number of units covered under the warranty period. While we engage in extensive quality programs and processes, our warranty obligation is affected by failure rates and service costs in correcting failures. As we have more units commissioned and longer periods of actual performance, additional data becomes available to assess expected warranty costs. When we have statistically valid evidence that product changes are altering the historical failure occurrence rates, the impact of such changes is then taken into account in estimating future warranty liabilities. Changes in estimates are recorded in the period that new information becomes available. Should actual failure rates or service costs differ from our estimates, revisions to the warranty liability would be required and could be material to our financial condition and results of operations.
- Our revenue consists of sales of products, parts, accessories and service, net of discounts and allowances for sales returns. Our distributors purchase products and parts for sale to end users and are also required to provide a variety of additional services, including application engineering, installation, commissioning and post-commissioning service. Our standard terms of sales to distributors and direct end users include transfer of title, care, custody and control at the point of shipment, payment terms ranging from full payment in advance of shipment to payment in 90 days, no right of return or exchange, and no post-shipment performance obligations by us except for warranties provided on the products and parts sold. We recognize revenue when all of the following criteria are met: persuasive evidence of an arrangement exists, delivery has occurred or service has been rendered, selling price is fixed or determinable and collectibility is reasonably assured. While there are no rights or return privileges on product sales, we have made some limited exceptions to the no-right-of-return policy. We have provided an allowance for future sales returns based on historical information. Our operating policy may change in the future. We occasionally enter into agreements that contain multiple elements, such as equipment, installation, engineering and/or service. For multiple-element arrangements, we recognize revenue for delivered elements when the delivered item has stand-alone value to the customer, fair values of undelivered elements are known and customer acceptance, if required, has occurred.
- We maintain allowances for doubtful accounts for estimated losses resulting from the inability of our customers to make required payments. If the financial condition of our customers deteriorates or if other conditions arise that result in an impairment of their ability or intention to make payments, additional allowances may be required.

- We have a history of unprofitable operations. These losses generated significant federal and state net operating loss (NOL) carryforwards. SFAS No. 109, Accounting for Income Taxes requires that we record a valuation allowance against the net deferred income tax assets associated with these NOLs if it is more likely than not that we will not be able to utilize them to offset future income taxes. Due to the uncertainty surrounding the timing of realizing the benefits of our favorable tax attributes in future income tax returns, a valuation allowance has been provided against all of our net deferred income tax assets. We currently provide for income taxes only to the extent that we expect to pay cash taxes, primarily state taxes. It is possible, however, that we could be profitable in the future at levels which could cause management to determine that it is more likely than not that we will realize all or a portion of the NOL carryforward.

Upon reaching such a conclusion, we would record the estimated net realizable value of the deferred income tax asset at that time. Such adjustment would increase income in the period that the determination was made.

- We account for contingencies in accordance with SFAS No. 5, *Accounting for Contingencies*. SFAS No. 5 requires that we record an estimated loss from a loss contingency when information available prior to issuance of our financial statements indicates that it is probable that an asset has been impaired or a liability has been incurred at the date of the financial statements and the amount of the loss can be reasonably estimated. Accounting for contingencies, such as legal matters, requires us to use our judgment. Any unfavorable outcome of litigation or other contingencies could have an adverse impact on our financial condition and results of operations.
- Our adoption of SFAS No. 123 (revised 2004), *Share-Based Payment* (SFAS 123(R)) in the first quarter of Fiscal 2007 requires that we recognize stock-based compensation expense associated with stock options in the statement of operations, rather than disclose it in a pro forma footnote to the consolidated financial statements. Determining the amount of stock-based compensation to be recorded requires us to develop estimates to be used in calculating the grant-date fair value of stock options. We calculate the grant-date fair values using the Black-Scholes valuation model. The use of valuation models requires us to make estimates of the following assumptions:
 - **Expected volatility** The estimated stock price volatility was derived based upon the Company's actual historic stock prices over the expected option life, which represents the Company's best estimate of expected volatility.
 - **Expected option life** The Company's estimate of an expected option life was calculated in accordance with the Staff Accounting Bulletin No. 107 simplified method for calculating the expected term assumption. This method is available for options granted prior to December 31, 2007.
 - **Risk-free interest rate** We used the yield on zero-coupon U.S. Treasury securities for a period that is commensurate with the expected life assumption as the risk-free interest rate.

The amount of stock-based compensation recognized during a period is based on the value of the portion of the awards that are ultimately expected to vest. SFAS 123(R) requires forfeitures to be estimated at the time of grant and revised, if necessary, in subsequent periods if actual forfeitures differ from those estimates. The term *forfeitures* is distinct from cancellations or expirations and represents only the unvested portion of the surrendered option. We reviewed historical forfeiture data and determined the appropriate forfeiture rate based on that data. We will re-evaluate this analysis periodically and adjust the forfeiture rate as necessary. Ultimately, we will recognize the actual expense over the vesting period only for the shares that vest.

Results of Operations

Year Ended March 31, 2007 Compared to Year Ended March 31, 2006

Revenue

Revenue is reported net of sales returns and allowances. Revenue for the year ended March 31, 2007 decreased \$3.1 million, or 13%, to \$21.0 million from \$24.1 million for the year ended March 31, 2006. Revenue from microturbine product shipments decreased \$3.7 million, or 19.7%, to \$15.1 million during Fiscal 2007 from \$18.8 million for Fiscal 2006. Shipments of microturbine units were 15.6 megawatts during Fiscal 2007 compared with 23.0 megawatts for Fiscal 2006. Revenue from accessories, parts and service for Fiscal 2007 increased \$0.6 million to \$5.9 million from \$5.3 million for Fiscal 2006. Included in the overall revenue decline was a \$2.0 million decrease in revenue from the North American market and a \$1.7 million decrease in revenue from the Asian market primarily the result of a decline in the activity of one distributor in each market. While sales have not increased at the expected rate, we continue to pursue market penetration through the use of worldwide distributors and our direct sales resources.

Two customers accounted for 16% and 12% of revenue for the year ended March 31, 2007, respectively. For the year ended March 31, 2006, three customers accounted for 17%, 14% and 10% of revenue, respectively. Banking Production Centre accounted for 16% and 10% of revenues for the year ended March 31, 2007 and 2006, respectively. UTC accounted for 12% and 17% of revenue for year ended March 31, 2007 and 2006, respectively.

Gross Loss

Cost of goods sold includes direct material costs, production overhead, inventory charges and provision for estimated product warranty expenses. The gross loss was \$5.0 million, or 24% of revenue, for the year ended March 31, 2007 compared to \$10.5 million, or 43% of revenue, for the year ended March 31, 2006. The decrease in the gross loss and corresponding improvement in the gross loss percentage reflects a change in product mix with increased sales of higher margin C60 Series units and reduced manufacturing costs of \$2.2 million as well as higher absorption of overhead costs into ending inventory of \$0.9 million and reduced inventory charges for excess, obsolete and scrapped inventory of \$3.9 million offset by increased warranty charges of \$1.4 million. Warranty expense for unit shipments decreased \$1.1 million as a result of lower volumes and improvements that have been made through engineering design changes and product robustness. This decrease was offset by an increase of \$2.5 million because of higher estimated costs of several reliability repair programs related to changes in the expected condition of the units that need repair. These changes have been evidenced by increased costs of repair work performed in the current year. These changes in program estimates are recorded in the period that new information, such as design changes, product enhancements and repair costs, becomes available.

We expect to continue to incur gross losses until we are able to achieve higher unit sales volumes to cover our fixed manufacturing costs. Additionally, other contributions to profitability include initiatives to further reduce direct material costs and reductions in other manufacturing and warranty costs.

Research and Development Expenses

Research and development (R&D) expenses include compensation, engineering department expenses, overhead allocations for administration and facilities and material costs associated with development. R&D expenses decreased \$1.6 million, or 15%, to \$9.4 million for the year ended March 31, 2007 from \$11.0 million for the year ended March 31, 2006. R&D expenses are reported net of benefits from cost-sharing programs, such as the DOE funding. The net decrease in R&D spending is the result of decreased development hardware and supplies costs for various engineering projects of \$0.8 million as well as decreases in labor and consulting spending of \$1.5 million, facilities expenses of \$0.3 million, other expenses of \$0.1 million, offset by increases in allocated overhead costs of \$0.4 million and a decrease in benefits from cost-sharing programs of \$0.7 million. Included in the net decrease in labor and consulting spending for the year ended March 31, 2007 were \$0.2 million of non-cash stock compensation charges. There were no such charges for the same period in the prior year. The non-cash stock compensation charge resulted from the Company's adoption of SFAS 123(R) during the first quarter of Fiscal 2007. Cost-sharing programs vary from period to period depending on the phases of the programs. We expect R&D expense in Fiscal 2008 to be lower than in Fiscal 2007. This change is expected to occur as a result of increased cost-sharing programs.

Selling, General and Administrative Expenses

Selling, general and administrative (SG&A) expenses include compensation and related expenses in support of our general corporate and sales functions, which include facilities, human capital, finance and accounting, shareholder relations, information systems and legal services. SG&A expenses decreased \$3.1 million, or 11%, to \$24.6 million for the year ended March 31, 2007 from \$27.8 million for the year ended March 31, 2006. Included in SG&A expenses for the year ended March 31, 2007 was \$2.3 million of non-cash stock compensation, compared to \$1.0 million for the same period last year. This increase is a result of the Company's adoption of SFAS 123(R) during the first quarter of Fiscal 2007. Other SG&A expenses decreased \$4.5 million compared to the prior year. Included in the SG&A decrease was \$1.9 million related to legal settlement costs incurred in the prior year, \$2.0 million related to reduced professional services including legal, accounting and insurance, labor and related costs of \$0.6 million, consulting fees of \$0.5 million and marketing costs of \$0.3 million, offset by increased facilities costs of \$0.3 million, bad debt expense of \$0.3 million and other administrative expenses of \$0.2 million. We expect SG&A costs in Fiscal 2008 to be slightly lower than Fiscal 2007.

Interest Income

Interest income for the year ended March 31, 2007 increased \$0.2 million, or 7%, to \$2.3 million from \$2.1 million for the same period last year. The increase during the current period was attributable to increased investment yields over the same period last year, offset by lower average cash balances during the year ended March 31, 2007. We expect interest income to decline for the year ending March 31, 2008 as we continue to use cash to support our operations.

Income Tax Provision

At March 31, 2007, we had federal and state net operating loss carryforwards of approximately \$433.6 million and \$290.8 million, respectively, which may be utilized to reduce future taxable income, subject to limitations under Section 382 of the Internal Revenue Code of 1986. We provided a valuation allowance for 100% of our net deferred tax asset of \$183.3 million at March 31, 2007 as the realization of the benefits of these favorable tax attributes in future income tax returns is not deemed more likely than not. Similarly, at March 31, 2006, the net deferred tax asset was fully reserved.

Year Ended March 31, 2006 Compared to Year Ended March 31, 2005

Revenue

Revenue increased \$7.1 million, or 42%, to \$24.1 million for the year ended March 31, 2006 from \$17.0 million for the year ended March 31, 2005, reflecting increased demand across products, parts, accessories and service in Fiscal 2006 resulting from increased market acceptance. Shipments during the period ended March 31, 2006 were 23.0 megawatts compared with 16.5 megawatts in the prior period. The overall revenue increase also reflects a product mix price change towards higher priced units. Revenue from parts and service for the year ended March 31, 2006 increased \$1.4 million, or 36%, to \$5.3 million from \$3.9 million for the year ended March 31, 2005.

Three customers accounted for 17%, 14% and 10% of the Company's net revenue, respectively, for the year ended March 31, 2006, totaling approximately 41%. For Fiscal 2005, one customer accounted for approximately 15% of revenue. UTC accounted for 17% and 15% of revenue for the years ended March 31, 2006 and 2005, respectively. Banking Production Centre accounted for 10% and 7% of revenue for the years ended March 31, 2006 and 2005, respectively. For the years ended March 31, 2006 and 2005, our top ten customers generated approximately 71% and 62%, respectively, of total revenue. This demonstrates that we continued to build strength in our distribution channel and the performance of our distribution base reflects the strategy we undertook at the beginning of Fiscal 2005. This strategy included focusing on target markets we believed held greater prospects for improved sales and improving the distribution channel. The change in the distribution channel entailed terminating some of the previously existing agreements and entering into new agreements with distributors and dealers we believed would be capable of growing sales in our targeted markets. Our efforts to develop our target markets in concert with a more productive base of distributors and dealers yielded the improved sales in Fiscal 2006 over Fiscal 2005.

Late in Fiscal 2006, we increased our product sales prices an average of approximately 7% in response to our increasing costs for commodity metals.

Gross Loss

The gross loss was \$10.5 million, or 43% of revenue, for the year ended March 31, 2006 compared to \$8.6 million, or 51% of revenue, for the year ended March 31, 2005. The improvement in the gross loss percentage reflected the operating leverage of increased revenue over fixed manufacturing costs. The operating leverage benefits were offset by increased inventory valuation charges of \$2.5 million and increased total warranty expense of \$1.4 million, compared to Fiscal 2005. However, warranty expense for unit shipments decreased approximately \$2.0 million as a result of improvements that were made through engineering design changes and product robustness. The amount of the net increase in warranty expense in Fiscal 2006 over Fiscal 2005 was primarily the result of the benefit of \$4.1 million recorded in Fiscal 2005 resulting from design changes and product enhancements. Throughout Fiscal 2005, we experienced reductions in the accruals for preexisting warranties and the reliability repair programs. The reductions in the preexisting warranties and the reliability repair programs arose because of improvements that were made through engineering design changes. Warranty expense is a combination of a per-unit warranty accrual recorded at the time the product is shipped and changes in estimates of several reliability enhancement programs. These changes in program estimates are recorded when we have statistically valid evidence that product changes are altering the historical failure occurrence rates. The increased inventory valuation charges during the fiscal year ended March 31, 2006 were net of a benefit of \$0.3 million recognized during the fiscal year ended March 31, 2005 for the use of previously fully written-down recuperator cores.

Research and Development Expenses

R&D expenses decreased \$0.8 million, or 6%, to \$11.0 million for the year ended March 31, 2006 from \$11.8 million for the year ended March 31, 2005. R&D expenses are reported net of benefits from cost sharing programs. These benefits were \$2.5 million in Fiscal 2006 compared to \$0.5 million in Fiscal 2005. The benefits from cost sharing programs vary from period-to-period depending on the phases of the related programs. Our remaining funding under the DOE Advanced Microturbine System program was approximately \$6.1 million as of March 31, 2006.

Selling, General and Administrative Expenses

SG&A expenses increased \$6.9 million, or 33%, to \$27.7 million for the year ended March 31, 2006 from \$20.8 million for the year ended March 31, 2005. Of the increased SG&A expenses between years, approximately \$2.0 million of the increase related to a Settlement Agreement with Interstate Companies, Inc. Additionally, \$0.9 million of the increase related to consulting costs, \$1.1 million was the result of legal and accounting fees and \$0.5 million related to severance expense. Approximately \$0.7 million of the increase was for marketing expense and \$1.0 million was for labor related costs, including salaries, recruitment and relocation expenses to support our continuous process improvement throughout the organization. Additionally, \$0.3 million of the increase related to increased facility maintenance costs and \$0.4 million was the result of increased other administrative costs.

Interest Income

Interest income for Fiscal 2006 increased \$0.8 million, or 60%, to \$2.1 million from \$1.3 million for Fiscal 2005. The increase during Fiscal 2006 was attributable to higher cash balances as a result of the \$39.2 million in net proceeds from the October 2005 equity offering in addition to increased investment yields over the same period.

Income Tax Provision

At March 31, 2006, we had federal and state net operating loss carryforwards of approximately \$394.1 million and \$272.1 million, respectively, which may be utilized to reduce future taxable income, subject to limitations. We provided a valuation allowance for 100% of our net deferred tax asset of \$169.4 million at March 31, 2006 as the realization of the benefits of these favorable tax attributes in future income tax returns is not deemed more likely than not. Similarly, at March 31, 2005, the net deferred tax asset was fully reserved.

Quarterly Results of Operations

The following table presents unaudited quarterly financial information. This information was prepared in accordance with GAAP, and, in the opinion of management, contains all adjustments necessary for a fair presentation of such quarterly information when read in conjunction with the financial statements included elsewhere herein. Our operating results for any prior quarters may not necessarily indicate the results for any future periods.

Amounts in thousands, except per share data

(Unaudited)	Year Ended March 31, 2007				Year Ended March 31, 2006			
	Fourth Quarter	Third Quarter	Second Quarter	First Quarter	Fourth Quarter	Third Quarter	Second Quarter	First Quarter

Liquidity and Capital Resources

Our cash requirements depend on many factors, including the execution of our plan. We expect to continue to devote substantial capital resources to running our business and creating the strategic changes summarized herein. Based on our current forecasts and assumptions, we believe that our existing cash and cash equivalents are sufficient to meet our anticipated cash needs for working capital and capital expenditures for at least the next twelve months. We have invested our cash in an institutional fund that invests in high quality short-term money market instruments to provide liquidity for operations and for capital preservation.

Our cash and cash equivalent balances increased \$2.3 million during the year ended March 31, 2007, inclusive of \$42.4 million of proceeds from our direct stock placement, compared to a decline of \$5.5 million for the year ended March 31, 2006. The cash was used in:

Operating Activities During the year ended March 31, 2007 we used \$40.4 million in cash in our operating activities, which primarily consisted of a net loss for the period of approximately \$36.7 million, offset by non-cash adjustments (primarily depreciation, warranty and inventory charges) of \$9.9 million and cash used for working capital of approximately \$13.6 million. This compared to operating cash usage of \$45.5 million during the year ended March 31,

2006, which consisted of a net loss for the period of approximately \$47.1 million, offset by non-cash adjustments (primarily depreciation and impairment charges) of \$9.7 million and cash used for working capital of approximately \$8.1 million. This reduction in net loss for Fiscal 2007 from Fiscal 2006 is primarily attributable to cost control measures. The change in working capital between periods is primarily attributable to inventory which has increased from purchases made in anticipation of expected future demands. Additionally, the change is attributable to a \$1.9 million decrease in accounts receivable resulting primarily from lower sales occurring at the end of the period compared with the prior year and an improvement in days of sales outstanding, and offset by \$2.4 million cash used for payments on accounts payable and accrued expenses. Both last year and this year, increase in inventories resulted in the use of working capital. Warranties used cash in each period due to increased cost for reliability campaigns. Net cash used for warranties was \$2.6 million in Fiscal 2007 and \$2.4 million in Fiscal 2006.

Investing Activities Net cash used in investing activities, primarily resulting from the acquisition of fixed assets, was \$1.4 million and \$1.1 million for the years ended March 31, 2007 and 2006, respectively. Our cash usage for investing activities has been relatively low related to capital expenditures.

Financing Activities During the year ended March 31, 2007, we generated \$44.2 million from financing activities as compared to cash generated in Fiscal 2006 of \$41.1 million. The funds generated from financing activities in the year ended March 31, 2007 were primarily the result of a direct placement of the Company's common stock, which was completed effective January 24, 2007. Pursuant to the offering, we issued a total of 40 million shares of common stock and warrants to purchase 20 million shares of common stock with an initial exercise price of \$1.30 per share, resulting in gross proceeds of approximately \$45.6 million, and incurred approximately \$3.2 million in direct costs. The funds generated from financing activities in the year ended March 31, 2006 were primarily the result of a registered offering of the Company's common stock, which was completed effective October 21, 2005. Pursuant to the offering, we issued a total of 17 million shares of common stock, resulting in gross proceeds of approximately \$41.4 million, and incurred approximately \$2.2 million in direct costs. The exercise of stock options and employee stock purchases yielded \$1.7 million in cash for the year ended March 31, 2007 as compared with \$1.8 million in Fiscal 2006. Repayments of capital lease obligations used \$20,000 during the year ended March 31, 2007 as compared with \$17,000 in the prior year because the leases were substantially paid down during Fiscal 2006.

We anticipate that as a result of our efforts to build sales and margins while controlling costs we will lower our cash usage. Our goal for the year ending March 31, 2008 is to use less cash for operating and investing activities than in Fiscal 2007.

Contractual Obligations and Commercial Commitments

At March 31, 2007, our commitments under the notes payable and non-cancelable operating leases were as follows:

	Payment Due by Period				
	Total (in Thousands)	Less than 1 Year	1 3 Years	3 5 Years	More than 5 Years
Contractual Obligations:					
Notes payable	\$ 47	\$ 19	\$ 28	\$	\$
Operating lease commitments	\$ 7,248	\$ 2,065	\$ 5,183	\$	\$

As of March 31, 2007, we had firm commitments to purchase inventories of approximately \$6.3 million. Inventory delivery dates and related payments are not firmly scheduled. Therefore, amounts under these firm purchase commitments will be due concurrent with the receipt of the related inventories.

In 2000, the DOE awarded us \$10.0 million under a Cooperative Agreement to develop an Advanced Microturbine System. The \$10.0 million award was to be distributed during the project period September 28, 2000 through July 1, 2005. In April 2005, the DOE amended the agreement and added a task to develop an Ultra-Low Emissions Microturbine. The award was increased to a total of \$17.7 million and the project period was extended through December 31, 2008. The program is estimated to cost a total of \$31.7 million over the eight year period, which would therefore require us to incur approximately \$18.2 million of the total R&D expenditures under this program. We billed the DOE under this agreement a cumulative amount of \$13.4 million through March 31, 2007. Our remaining funding under this program is approximately \$4.3 million as of March 31, 2007 which would require us to provide at least \$6.2 million of additional R&D expenditures.

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

In 2001, we were awarded a \$3.0 million grant from the DOE for the research, development and testing of packaged cooling, heating and power systems for buildings. The contract is estimated to cost \$5.5 million, which would therefore require us to incur approximately \$2.5 million of the total R&D expenditures under this program. We billed the DOE under this contract a cumulative amount of \$1.3 million through March 31, 2007. Our remaining funding under this program is

33

approximately \$3.0 million as of March 31, 2007 which would require us to provide at least \$4.3 million of our own R&D expenditures. However, we do not expect to continue work under this specific project.

Off-Balance Sheet Arrangements

The Company does not have any off-balance sheet arrangements.

Impact of Recently Issued Accounting Standards

In January 2007, the Financial Accounting Standards Board (FASB) issued SFAS No. 159, The Fair Value Option for Financial Assets and Financial Liabilities. This statement permits entities to choose to measure many financial instruments and certain other items at fair value at specified election dates, amends FASB Statement No. 115 Accounting for Certain Investments in Debt and Equity Securities and expands disclosures related to the use of fair value measures in financial statements. This Statement is effective as of the beginning of an entity's first fiscal year that begins after November 15, 2007. We are evaluating any impact that the adoption of this pronouncement may have on our consolidated financial position or results of operations.

In September 2006, the FASB issued SFAS No. 157, Fair Value Measurements. SFAS No. 157 defines fair value, establishes a framework for measuring fair value in generally accepted accounting principles, and expands disclosures about fair value measurements. SFAS No. 157 applies under other accounting pronouncements that require or permit fair value measurements, the FASB having previously concluded in those accounting pronouncements that fair value is the relevant measurement attribute. Accordingly, SFAS No. 157 does not require any new fair value measurements. This statement is effective for financial statements issued for fiscal years beginning after November 15, 2007, and interim periods within those fiscal years. We are evaluating any impact that the adoption of this pronouncement may have on our consolidated financial position or results of operations.

In September 2006, the Securities and Exchange Commission (SEC) issued Staff Accounting Bulletin No. 108 (SAB 108), Considering the Effects of Prior Year Misstatements When Quantifying Misstatements in Current Year Financial Statements. Because of diversity in practice among registrants, SAB 108 expresses SEC staff views regarding the process by which misstatements in financial statements are evaluated for purposes of determining whether financial statement restatement is necessary. SAB 108 is effective for fiscal years ending after November 15, 2006; therefore, we adopted this interpretation during the fourth quarter of Fiscal 2007. Adopting SAB 108 did not have a material impact on our consolidated financial position or results of operations.

In June 2006, the FASB issued Interpretation No. 48 (FIN 48), Accounting for Uncertainty in Income Taxes, an interpretation of FASB Statement No. 109, Accounting for Income Taxes. FIN 48 clarifies the accounting for income taxes, by prescribing a minimum recognition threshold a tax position is required to meet before being recognized in the financial statements. FIN 48 also provides guidance on derecognition, measurement, classification, interest and penalties, accounting in interim periods, disclosure and transition. This interpretation is effective for fiscal years beginning after December 15, 2006. We will adopt FIN 48 as of April 1, 2007, as required. The cumulative effect of adopting FIN 48 will be recorded in retained earnings and other accounts as applicable. We not expect that the adoption of FIN 48 will have a significant impact on our consolidated financial position or results of operations.

Item 7A. Quantitative and Qualitative Disclosure About Market Risk.

Foreign Currency

We currently develop products in the U.S. and market and sell our products predominantly in North America, Europe and Asia. As a result, factors such as changes in foreign currency exchange rates or weak economic conditions in foreign markets could affect our financial results. As all of our sales and purchases are currently made in U.S. dollars, we do not utilize foreign exchange contracts to reduce our exposure to foreign currency fluctuations. In the future, as our customers, employees and vendor bases expand, we anticipate entering into more transactions that are denominated in foreign currencies.

Interest

We have no significant long-term debt outstanding and do not use any derivative instruments. We have invested our cash in an institutional fund that invests in high quality short-term money market instruments.

Item 8. Financial Statements and Supplementary Data.

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

The Company's Consolidated Financial Statements and Schedule included in this Report beginning at page F-1 are incorporated in this Item 8 by reference.

34

Item 9. Changes in and Disagreements with Accountants on Accounting and Financial Disclosure.

None.

Item 9A. Controls and Procedures.

Disclosure Controls and Procedures

The Company maintains disclosure controls and procedures that are designed to ensure that the information required to be disclosed in the Company's reports under the Securities Exchange Act of 1934, as amended (the Exchange Act), is recorded, processed, summarized, and reported within the time periods specified in the SEC's rules and forms, and that such information is accumulated and communicated to management, including our Chief Executive Officer (CEO) and Chief Financial Officer (CFO), as appropriate, to allow timely decisions regarding required disclosure. In designing and evaluating the disclosure controls and procedures, management recognized that any controls and procedures, no matter how well designed and operated, can provide only reasonable assurance of achieving the desired control objectives.

In connection with the preparation of this Annual Report on Form 10-K as of March 31, 2007, an evaluation was performed under the supervision and with the participation of our management, including the CEO and CFO, of the effectiveness of the design and operation of our disclosure controls and procedures (as defined in Rule 13a-15(e) under the Exchange Act). Based on this evaluation, our CEO and CFO have concluded that our disclosure controls and procedures are effective as of March 31, 2007 to ensure that the information required to be disclosed by us in reports we submit under the Exchange Act is recorded, processed, summarized, and reported within the time periods specified in the rules and forms of the SEC and that such information is accumulated and communicated to management, including our CEO and CFO, as appropriate, to allow timely decisions regarding required disclosure.

Management's Annual Report on Internal Control Over Financial Reporting

Our management is responsible for establishing and maintaining adequate internal control over financial reporting, as such term is defined in Exchange Act Rules 13a-15(f) and 15d-15(f). Under the supervision and with the participation of our management, including our CEO and CFO, we conducted an evaluation of the effectiveness of our internal control over financial reporting based on the framework in Internal Control Integrated Framework issued by the Committee of Sponsoring Organization of the Treadway Commission. Based on our evaluation under the framework in Internal Control Integrated Framework, our management concluded that the Company maintained effective internal control over financial reporting as of March 31, 2007. Our management's assessment of the effectiveness of our internal control over financial reporting as of March 31, 2007 has been attested to and reported on by Deloitte & Touche LLP, our independent registered public accounting firm. The independent registered accounting firm's attestation report follows. Projections of any evaluation of effectiveness to future periods are subject to the risks that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

Changes in Internal Control Over Financial Reporting

There were no changes in the Company's internal control over financial reporting during the three-month period ended March 31, 2007 which have materially affected, or are reasonably likely to materially affect, the Company's internal control over financial reporting.

35

REPORT OF INDEPENDENT REGISTERED PUBLIC ACCOUNTING FIRM

To the Board of Directors and Stockholders of
Capstone Turbine Corporation
Chatsworth, California

We have audited management's assessment, included in the accompanying Management's Annual Report on Internal Control Over Financial Reporting, that Capstone Turbine Corporation and subsidiary (the Company) maintained effective internal control over financial reporting as of March 31, 2007, based on criteria established in *Internal Control - Integrated Framework* issued by the Committee of Sponsoring Organizations of the Treadway Commission. The Company's management is responsible for maintaining effective internal control over financial reporting and for its assessment of the effectiveness of internal control over financial reporting. Our responsibility is to express an opinion on management's assessment and an opinion on the effectiveness of the Company's internal control over financial reporting based on our audit.

We conducted our audit in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether effective internal control over financial reporting was maintained in all material respects. Our audit included obtaining an understanding of internal control over financial reporting, evaluating management's assessment, testing and evaluating the design and operating effectiveness of internal control, and performing such other procedures as we considered necessary in the circumstances. We believe that our audit provides a reasonable basis for our opinions.

A company's internal control over financial reporting is a process designed by, or under the supervision of, the company's principal executive and principal financial officers, or persons performing similar functions, and effected by the company's board of directors, management, and other personnel to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use, or disposition of the company's assets that could have a material effect on the financial statements.

Because of the inherent limitations of internal control over financial reporting, including the possibility of collusion or improper management override of controls, material misstatements due to error or fraud may not be prevented or detected on a timely basis. Also, projections of any evaluation of the effectiveness of the internal control over financial reporting to future periods are subject to the risk that the controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

In our opinion, management's assessment that the Company maintained effective internal control over financial reporting as of March 31, 2007, is fairly stated, in all material respects, based on the criteria established in *Internal Control - Integrated Framework* issued by the Committee of Sponsoring Organizations of the Treadway Commission. Also in our opinion, the Company maintained, in all material respects, effective internal control over financial reporting as of March 31, 2007, based on the criteria established in *Internal Control - Integrated Framework* issued by the Committee of Sponsoring Organizations of the Treadway Commission.

We have also audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), the consolidated financial statements and financial statement schedule as of and for the year ended March 31, 2007 of the Company and our report dated June 13, 2007 expressed an unqualified opinion on those financial statements and financial statement schedule and included an explanatory paragraph regarding the Company's adoption of Statement of Financial Accounting Standards No. 123R, Share-Based Payment, effective April 1, 2006.

REPORT OF INDEPENDENT REGISTERED PUBLIC ACCOUNTING FIRM

To the Board of Directors and Stockholders of
Capstone Turbine Corporation
Chatsworth, California

We have audited the accompanying consolidated balance sheets of Capstone Turbine Corporation and subsidiary (the Company) as of March 31, 2007 and 2006, and the related consolidated statements of operations, stockholders' equity, and cash flows for each of the three years in the period ended March 31, 2007. Our audits also include a financial statement schedule listed in the Index at Item 15. These financial statements and financial statement schedule are the responsibility of the Company's management. Our responsibility is to express an opinion on these financial statements and financial statement schedule based on our audits.

We conducted our audits in accordance with standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation. We believe that our audits provide a reasonable basis for our opinion.

In our opinion, such consolidated financial statements present fairly, in all material respects, the financial position of the Company as of March 31, 2007 and 2006, and the results of its operations and its cash flows for each of the three years in the period ended March 31, 2007, in conformity with accounting principles generally accepted in the United States of America. Also, in our opinion, such financial statement schedule, when considered in relation to the basic consolidated financial statements taken as a whole, present fairly, in all material respects, the information set forth therein.

As discussed in Notes 2 and 8 to the consolidated financial statements, the Company adopted, effective April 1, 2006, Statement of Financial Accounting Standards No. 123R, Share-Based Payment.

We have also audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), the effectiveness of the Company's internal control over financial reporting as of March 31, 2007, based on *Internal Control - Integrated Framework* issued by the Committee of Sponsoring Organizations of the Treadway Commission and our report dated June 13, 2007 expressed an unqualified opinion on management's assessment of the effectiveness of the Company's internal control over financial reporting and an unqualified opinion on the effectiveness of the Company's internal control over financial reporting.

Cash and Cash Equivalents, Beginning of Year	58,051	63,593	102,380
Cash and Cash Equivalents, End of Year	\$ 60,322	\$ 58,051	\$ 63,593
Supplemental Disclosures of Cash Flow Information:			
Cash paid during the year for:			
Interest	\$ 2	\$ 23	\$ 35
Income taxes	\$ 2	\$ 2	\$ 2
Supplemental Disclosures of Non-Cash Information:			

During the years ended March 31, 2007 and 2006, the Company purchased \$11,000 and \$107,000 of equipment on accounts payable outstanding as of March 31, 2007 and 2006, respectively. Additionally, during the year ended March 31, 2005, the Company financed equipment acquisitions \$96,000 through a note payable obligation.

See accompanying notes to consolidated financial statements.

**CAPSTONE TURBINE CORPORATION AND SUBSIDIARY
NOTES TO CONSOLIDATED FINANCIAL STATEMENTS**

1. Description of the Company and Basis of Presentation

Capstone Turbine Corporation (the Company) develops, manufactures, markets and services microturbine technology solutions for use in stationary distributed power generation applications, including cogeneration (combined heat and power (CHP) and combined cooling, heat and power (CCHP)), resource recovery (including renewable fuels) and secure power. In addition, the Company's microturbines can be used as generators for hybrid electric vehicle applications. The Company was organized in 1988 and has been commercially producing its microturbine generators since 1998.

The Company has incurred significant operating losses since its inception. Management anticipates incurring additional losses until the Company can produce sufficient revenue to cover its operating costs. To date, the Company has funded its activities primarily through private and public equity offerings.

The consolidated financial statements include the accounts of the Company and Capstone Turbine International, Inc., its wholly owned subsidiary that was formed in June 2004, after elimination of inter-company transactions.

2. Summary of Significant Accounting Policies

Cash Equivalents The Company considers only those investments that are highly liquid, readily convertible to cash with original maturities of three months or less at date of purchase as cash equivalents.

Financial Instruments The carrying value of certain financial instruments, including cash and cash equivalents, accounts receivable, accounts payable and accrued expenses approximate fair market value based on their short-term nature. The carrying value of notes payable approximates fair value due to the relatively short period of remaining terms for the same or similar debt instruments.

Accounts Receivable The Company maintains allowances for doubtful accounts for estimated losses resulting from the inability of customers to make required payments. The Company also provides an allowance for sales returns. While the Company sells without rights of return, because occasional exceptions have been made, an allowance is provided based on historical return rates.

Inventories The Company values inventories at lower of cost or market. The composition of inventory is routinely evaluated to identify slow-moving, excess, obsolete or otherwise impaired inventories. Inventories identified as impaired are evaluated to determine if write-downs are required. Included in the assessment is a review for obsolescence as a result of engineering changes in the Company's products. All inventories expected to be used in more than one year are classified as long-term.

Depreciation and Amortization Depreciation and amortization are provided for using the straight-line method over the estimated useful lives of the related assets, ranging from two to ten years. Leasehold improvements are amortized over the period of the lease or the estimated useful lives of the assets, whichever is shorter. Intangible assets that have finite useful lives are amortized over their estimated useful lives using the straight-line method. Amortization of assets under capital leases and intangible assets are included with depreciation and amortization expense.

Long-Lived Assets The Company reviews the recoverability of long-lived assets whenever events or changes in circumstances indicate that the carrying value of such assets may not be recoverable. If the expected future cash flows from the use of such assets (undiscounted and without interest charges) are less than the carrying value, the Company's policy is to record a write-down, which is determined based on the difference between the carrying value of the assets and their estimated fair value.

Deferred Revenue *Deferred* revenue consists of deferred product and service revenue, and customer deposits. Deferred revenue will be recognized when earned in accordance with the Company's revenue recognition policy. The Company has the right to retain all or part of deposits under certain conditions.

Revenue *The* Company's revenue consists of sales of products, parts, accessories and service, net of discounts and allowances for sales returns. Capstone's distributors purchase products and parts for sale to end users and are also required to provide a variety of additional services, including application engineering, installation, commissioning and post-commissioning repair and maintenance service. The Company's standard terms of sales to distributors and direct end-users include transfer of title, care, custody and control at the point of shipment, payment terms ranging from full payment in

F-7

advance of shipment to payment in 90 days, no right of return or exchange, and no post-shipment performance obligations by Capstone except for warranties provided on the products and parts sold. Revenue is generally recognized and earned when all of the following criteria are satisfied: (a) persuasive evidence of a sales arrangement exists; (b) price is fixed or determinable; (c) collectibility is reasonably assured; and (d) delivery has occurred or service has been rendered. Delivery generally occurs when the title and the risks and rewards of ownership have substantially transferred to the customer. While there are no rights of return privileges on product sales, the Company has made some limited exceptions to the no-right-of-return policy. Therefore, the Company has provided for an allowance for future sales returns based on historical information. To date, the Company has not had significant levels of service revenue. Service performed by the Company has consisted primarily of commissioning and time and materials based contracts. The time and materials contracts are usually related to out-of-warranty units. Service revenue derived from time and materials contracts is recognized as performed. The Company has also started providing maintenance service contracts to the customers of its existing install base. The maintenance service contracts are agreements to perform certain agreed-upon service to maintain a product for a specified period of time. Service revenue derived from maintenance service contracts is recognized on a straight-line basis over the contract period. The Company occasionally enters into agreements that contain multiple elements, such as equipment, installation, engineering and/or service. For multiple-element arrangements, the Company recognizes revenue for delivered elements when the delivered item has stand-alone value to the customer, fair values of undelivered elements are known and customer acceptance provisions, if any, have occurred.

Warranty *The* Company provides for the estimated costs of warranties at the time revenue is recognized. The specific terms and conditions of those warranties vary depending upon the product sold, geography of sale and the length of extended warranties sold. The Company's product warranties generally start from the delivery date and continue for up to eighteen months. Factors that affect the Company's warranty obligation include product failure rates, anticipated hours of product operations and costs of repair or replacement in correcting product failures. These factors are estimates that may change based on new information that becomes available each period. Similarly, the Company also accrues the estimated costs to address reliability repairs on products no longer in warranty when, in the Company's judgment, and in accordance with a specific plan developed by the Company, it is prudent to provide such repairs. The Company assesses the adequacy of recorded warranty liabilities quarterly and makes adjustments to the liability as necessary. When the Company has statistically valid evidence that product changes are altering the historical failure occurrence rates, the impact of such changes is then taken into account in estimating future warranty liabilities.

Research and Development (R&D) *The* Company accounts for grant distributions as offsets to R&D expenses and are recorded as the related costs are incurred. Total offsets to R&D expenses amounted to \$1.8 million, \$2.5 million and \$0.5 million, for the years ended March 31, 2007, 2006 and 2005, respectively.

Income Taxes *Deferred* income tax assets and liabilities are computed for differences between the consolidated financial statement and income tax basis of assets and liabilities. Such deferred income tax asset and liability computations are based on enacted tax laws and rates applicable to periods in which the differences are expected to reverse. Valuation allowances are established, when necessary, to reduce deferred income tax assets to the amounts expected to be realized.

Contingencies *The* Company accounts for contingencies in accordance with Statement of Financial Accounting Standards (SFAS) No. 5, Accounting for Contingencies . SFAS No. 5 requires that the Company record an estimated loss from a loss contingency when information available prior to issuance of its financial statements indicates that it is probable that an asset has been impaired or a liability has been incurred at the date of the financial statements and the amount of the loss can be reasonably estimated.

Risk Concentrations *Financial* instruments that potentially subject the Company to concentrations of credit risk consist primarily of cash and cash equivalents and accounts receivable. The Company places its cash and cash equivalents with high credit quality institutions. The Company performs ongoing credit evaluations of its customers and maintains an allowance for potential credit losses.

The Company sells only microturbines and related parts and service. Two customers accounted for 16% and 12% of the Company's net revenue for the year ended March 31, 2007, totaling approximately 28%. Three customers accounted for 17%, 14% and 10% of the Company's net revenue for the year ended March 31, 2006, totaling approximately 41%. One customer accounted for 15% of the Company's net revenue for the year ended March 31, 2005. Accounts receivable included \$0 , \$1.6 million and \$0.5 million for unpaid billings to the government under

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

cost-sharing programs at March 31, 2007, 2006 and 2005, respectively. Additionally, three customers accounted for 19%, 15% and 11% of gross accounts receivable as of March 31, 2007, totaling approximately 45%. One customer accounted for 27% of gross accounts receivable as of March 31, 2006.

F-8

The Company's production relies on metals, which are currently in high demand and therefore can be difficult or expensive to obtain. Additionally, several components of the Company's products are available from a limited number of suppliers. An interruption in supply could cause a delay in manufacturing and a possible loss of sales, which would affect operating results adversely.

Estimates and Assumptions The preparation of financial statements in conformity with accounting principles generally accepted in the United States of America requires management to make certain estimates and assumptions that affect the amounts reported in the financial statements and accompanying notes. Significant estimates include accounting for doubtful accounts, depreciation and amortization, inventory write-downs, valuation of assets including intangible assets, product warranties, sales allowances, income taxes and other contingencies. Actual results could differ from those estimates.

Net Loss Per Common Share **Basic** loss per common share is computed using the weighted-average number of common shares outstanding for the period. For purposes of computing basic loss per share and diluted loss per share, shares of restricted common stock which are contingently returnable (i.e., subject to repurchase if the purchaser's status as an employee or consultant terminates) are not considered outstanding until they are vested. Diluted loss per share is also computed without consideration to potentially dilutive instruments because the Company incurred losses which would make such instruments antidilutive. Outstanding stock options at March 31, 2007, 2006 and 2005, were 10.3 million, 10.4 million and 9.0 million, respectively.

Stock-Based Compensation On April 1, 2006, the Company adopted Statement of Financial Accounting Standards No. 123 (revised 2004), Share-Based Payment, (SFAS 123(R)), which requires the measurement and recognition of compensation expense for all stock options issued to employees and directors based on estimated fair values. SFAS 123(R) supersedes the Company's previous accounting under Accounting Principles Board Opinion No. 25, Accounting for Stock Issued to Employees (APB 25). In March 2005, the Securities and Exchange Commission (SEC) issued Staff Accounting Bulletin No. 107 (SAB 107) relating to SFAS 123(R). The Company has applied the provisions of SAB 107 in its adoption of SFAS 123(R).

The Company adopted SFAS 123(R) using the modified prospective transition method. The Company's consolidated financial statements as of and for the fiscal year ended March 31, 2007 reflect the impact of SFAS 123(R). In accordance with the modified prospective transition method, the Company's consolidated financial statements for prior periods have not been restated to reflect, and do not include, the impact of SFAS 123(R). Stock-based compensation expense for the year ended March 31, 2007, 2006 and 2005 was \$2.7 million, \$1.0 million and \$0.4 million, respectively. The impact of the adoption of SFAS 123(R) increased the net loss by \$2.4 million and increased the basic and diluted net loss per common share by \$0.02 for the year ended March 31, 2007.

As noted above, prior to the adoption of SFAS 123(R), the Company accounted for stock-based awards to employees and directors using the intrinsic value method in accordance with APB 25. The Company also accounted for equity instruments issued to non-employees using the fair value at the date of grant as prescribed by SFAS No. 123, Accounting for Stock-Based Compensation and Emerging Issues Task Force No. 96-18, Accounting for Equity Instruments That Are Issued to Other Than Employees for Acquiring, or in Conjunction with Selling, Goods or Service. The following table illustrates the effect on stock-based compensation expense and net loss per common share if the Company had applied the fair value recognition provisions of SFAS 123 to its employee and director stock option grants, stock purchases, restricted stock and stock awards for the years ended March 31, 2006 and 2005 (in thousands, except per share data):

	Year Ended March 31, 2006	Year Ended March 31, 2005
Net loss, as reported	\$ (47,073)	\$ (39,449)
Add: Stock-based employee and director compensation included in reported net loss	274	151
Deduct: Total stock-based employee and director compensation expense determined under fair value based method	(3,403)	(3,803)
Pro forma net loss	\$ (50,202)	\$ (43,101)
Net loss per share Basic and Diluted:		
As reported	\$ (0.50)	\$ (0.47)
Pro forma	\$ (0.54)	\$ (0.51)

The Company calculated the estimated fair value of each stock option on the date of grant using the Black-Scholes option-pricing model and the following weighted-average assumptions:

	Fiscal Year Ended March 31, 2006	Fiscal Year Ended March 31, 2005
Risk-free interest rates	4.2	% 3.6 %
Expected lives (in years)	5.6	5.0
Dividend yield		% %
Expected volatility	105.0	% 109.0 %
Weighted average volatility	105.0	% 109.0 %

On November 10, 2005, the Financial Accounting Standards Board (FASB) issued FASB Staff Position No. SFAS 123(R)-3, Transition Election Related to Accounting for Tax Effects of Share-Based Payment Awards. The alternative transition method includes simplified methods to establish the beginning balance of the additional paid-in capital pool (APIC pool) related to the tax effects of employee share-based compensation, and to determine the subsequent impact on the APIC pool and consolidated statements of cash flows of the tax effects of employee share-based compensation awards that are outstanding upon adoption of SFAS 123(R). We are currently in the process of evaluating whether to adopt the provisions of SFAS 123(R)-3.

Prior to the adoption of SFAS 123(R), the Company would have presented all tax benefits resulting from the exercise of stock options as operating cash inflows in the consolidated statements of cash flows, in accordance with the provisions of the Emerging Issues Task Force Issue No 00-15, Classification in the Statement of Cash Flows of the Income Tax Benefit Received by a Company upon Exercise of a Nonqualified Employee Stock Option. However, the Company has not recorded tax benefits associated with the exercise of stock options based on the losses incurred to date. SFAS 123(R) requires the benefits of tax deductions in excess of the compensation cost recognized for those options to be classified as financing cash inflows rather than operating cash inflows, on a prospective basis.

Segment Reporting *The* Company is considered to be a single operating segment in conformity with SFAS No. 131, Disclosures about Segments of an Enterprise and Related Information. The business activities of this operating segment are the development, manufacture and sale of turbine generator sets and their related parts and service. Following is the geographic revenue information based on the customer's primary operating location:

	Year Ended March 31,		
	2007	2006	2005
	(In thousands)		
United States	\$ 10,222	\$ 9,980	\$ 8,859
France	86	3,399	886
Russia	3,385	2,525	1,106
Mexico	46	2,485	1,075
Japan	549	1,734	1,659
All others	6,730	3,980	3,383
Total Net Revenue	\$ 21,018	\$ 24,103	\$ 16,968

Substantially all of the Company's operating assets are in the United States.

New Accounting Pronouncements In January 2007, the FASB issued SFAS No. 159, The Fair Value Option for Financial Assets and Financial Liabilities. This statement permits entities to choose to measure many financial instruments and certain other items at fair value at specified election dates, amends FASB Statement No. 115 Accounting for Certain Investments in Debt and Equity Securities and expands disclosures related to the use of fair value measures in financial statements. This Statement is effective as of the beginning of an entity's first fiscal year that begins after November 15, 2007. The Company is evaluating any impact that the adoption of this pronouncement may have on the Company's consolidated financial position or results of operations.

In September 2006, the FASB issued SFAS No. 157, Fair Value Measurements. SFAS No. 157 defines fair value, establishes a framework for measuring fair value in generally accepted accounting principles, and expands disclosures about fair value measurements. SFAS No. 157 applies under other accounting pronouncements that require or permit fair value measurements, the FASB having previously concluded in those accounting pronouncements that fair value is the relevant measurement attribute. Accordingly, SFAS No. 157 does not require any new fair value measurements. This statement is effective for financial statements issued for fiscal years beginning after November 15, 2007, and interim periods within those fiscal years. The Company is evaluating any impact that the adoption of this pronouncement may have on the Company's consolidated financial position or results of operations.

In September 2006, the SEC issued Staff Accounting Bulletin No. 108 (SAB 108), Considering the Effects of Prior Year Misstatements When Quantifying Misstatements in Current Year Financial Statements. Because of diversity in practice among registrants, SAB 108 expresses SEC staff views regarding the process by which misstatements in financial statements are evaluated for purposes of determining whether financial statement restatement is necessary. SAB 108 is effective for fiscal years ending after November 15, 2006, and early application is encouraged. The Company adopted SAB 108 for the fiscal year ended March 31, 2007 and such adoption had no impact on the Company's consolidated financial position or results of operations.

In June 2006, the FASB issued Interpretation No. 48 (FIN 48), Accounting for Uncertainty in Income Taxes, an interpretation of FASB Statement No. 109, Accounting for Income Taxes. FIN 48 clarifies the accounting for income taxes, by prescribing a minimum recognition threshold a tax position is required to meet before being recognized in the financial statements. FIN 48 also provides guidance on derecognition, measurement, classification, interest and penalties, accounting in interim periods, disclosure and transition. This interpretation is effective for fiscal years beginning after December 15, 2006. The Company will adopt FIN 48 as of April 1, 2007, as required. The cumulative effect of adopting FIN 48 will be recorded in retained earnings and other accounts as applicable. The Company does not expect that the adoption of FIN 48 will have a significant impact on the Company's consolidated financial position or results of operations.

3. Inventories

Inventories are stated at the lower of standard cost (which approximates actual cost on the first-in, first-out method) or market and consist of the following as of March 31, 2007 and 2006:

	2007 (In thousands)	2006
Raw materials	\$ 17,581	\$ 13,237
Work in process	1,086	705
Finished goods	5,621	1,716
Total	24,288	15,658
Less non-current portion	3,005	3,113
Current portion	\$ 21,283	\$ 12,545

The non-current portion of inventories represents that portion of the inventories in excess of amounts expected to be sold or used in the next twelve months.

4. Property, Plant and Equipment

Property, plant and equipment as of March 31, 2007 and 2006 consisted of the following:

	2007 (In thousands)	2006	Estimated Useful Life
Machinery, equipment, automobiles and furniture	\$ 18,198	\$ 18,493	2-10 years
Leasehold improvements	8,730	8,656	10 years
Molds and tooling	3,713	3,538	2-5 years
	30,641	30,687	
Less, accumulated depreciation	(24,385)	(22,871)	
Total property, plant and equipment, net	\$ 6,256	\$ 7,816	

Depreciation expense was \$2.7 million, \$3.9 million and \$4.9 million for the years ended March 31, 2007, 2006 and 2005, respectively.

5. Intangible Assets

The Company's sole intangible asset is a manufacturing license. The gross carrying amount is \$3.7 million. The balance of the intangible asset was \$0.9 million and \$1.2 million for the years ended March 31, 2007 and 2006, respectively. The intangible asset is being amortized over its estimated useful life of ten years. The Company recorded \$0.3 million of amortization expense for each of the years ended March 31, 2007, 2006 and 2005. The manufacturing license is scheduled to be fully amortized by fiscal year 2011 with corresponding amortization estimated to be \$0.3 million, \$0.3 million, \$0.3 million and \$89,000 for fiscal years, 2008, 2009, 2010 and 2011, respectively.

In 2000, the Company entered into a Transition Agreement and Amended and Restated License Agreement with a supplier. Under the terms of the agreements, the Company acquired fixed assets and manufacturing technology, which provide the Company with the ability to manufacture recuperator cores previously purchased from the supplier, for \$9.1 million. The agreements also require the Company to pay a per-unit royalty fee over a seventeen-year period for cores manufactured and sold by the Company using the technology. Royalties of \$28,000, \$54,000 and \$23,000 were earned under the terms of the agreements for the years ended March 31, 2007, 2006 and 2005, respectively. No royalties were earned in prior periods. As a result of these agreements, the Company and the supplier mutually terminated any obligations under their prior agreements.

6. Accrued Warranty Reserve

Changes in the accrued warranty reserve are as follows as of March 31, 2007, 2006 and 2005:

	2007 (In thousands)	2006	2005
Balance, beginning of the period	\$ 6,998	\$ 8,667	\$ 11,695
Warranty provision relating to products shipped during the period	408	1,455	3,410
Changes for accruals related to preexisting warranties or reliability repair programs	1,774	(694)	(4,092)
Deductions for warranty claims	(2,626)	(2,430)	(2,346)
Balance, end of the period	\$ 6,554	\$ 6,998	\$ 8,667

7. Income Taxes

The Company's deferred tax assets and liabilities consisted of the following at March 31, 2007 and 2006:

	2007 (In thousands)	2006
Deferred tax assets:		
Inventories	\$ 1,500	\$ 2,933
Warranty reserve	2,634	2,812
Deferred revenue	201	254
Net operating loss (NOL) carryforwards	165,426	150,833
Tax credit carryforwards	18,262	17,072
Depreciation, amortization and impairment loss	1,742	1,572
Other	2,790	2,748
Total deferred tax assets	192,556	178,224
Deferred tax liabilities:		
State taxes	(9,293)	(8,800)
Net deferred tax assets before valuation allowance	183,263	169,423
Valuation allowance	(183,263)	(169,423)
Total deferred income tax assets	\$	\$

Due to the uncertainty surrounding the timing of realizing the benefits of favorable tax attributes in future income tax returns, the Company has placed a valuation allowance against its deferred income tax assets. The change in valuation allowance for fiscal 2007 and 2006 was \$13.9 million and \$14.5 million, respectively.

The Company's NOL and tax credit carryforwards for federal and state income tax purposes at March 31, 2007 were as follows (In thousands):

	Amount (In thousands)	Expiration Period
Federal NOL	\$ 433,625	2008-2027
State NOL	\$ 290,789	2008-2012
Federal tax credit carryforwards	\$ 10,290	2008-2027
State tax credit carryforwards	\$ 7,973	Various

The NOLs and federal and state tax credits can be carried forward to offset future taxable income, if any. Utilization of the net operating losses and tax credits are subject to an annual limitation of approximately \$57.6 million due to the ownership change limitations provided by the Internal Revenue Code of 1986 and similar state provisions. The federal tax credit carryforward is a Research and Development credit, which may be carried forward. The state tax credits consist of a Manufacturer's Investment Credit of approximately \$0.8 million, which expires from 2008-2014, as well as a Research and Development Credit of approximately \$7.2 million, which may be carried forward indefinitely.

Tax benefits arising from the disposition of certain shares issued upon exercise of stock options within two years of the date of grant or within one year of the date of exercise by the option holder (Disqualifying Dispositions) provide the Company with a tax deduction equal to the difference between the exercise price and the fair market value of the stock on the date of exercise. Approximately \$28.0 million of the Company's federal and state NOL carryforwards as of March 31, 2007 were generated by Disqualifying Dispositions of stock options and exercises of nonqualified stock options. Upon realization, if any, tax benefits of approximately \$10.7 million associated with these stock options would be excluded from the provision for income taxes and credited directly to additional paid-in-capital.

A reconciliation of income tax benefit to the federal statutory rate follows:

	Year Ended March 31,		
	2007	2006	2005
	(In thousands)		
Federal income tax at the statutory rate	\$ (12,488)	\$ (16,005)	\$ (13,412)
State taxes, net of federal effect	(1,500)	(1,923)	(2,302)
Impact of rate change		4,377	
Valuation allowance	13,839	14,512	14,880
Other	149	(961)	834
Income tax benefit	\$	\$	\$

8. Stockholders' Equity

Stock Plans

1993 Incentive Stock Plan and 2000 Stock Incentive Plan

In 1993, the Board of Directors adopted and the stockholders approved the 1993 Incentive Stock Plan (1993 Plan). A total of 7,800,000 shares of common stock were initially reserved for issuance under the 1993 Plan. In June 2000, the Company adopted the 2000 Equity Incentive Plan (2000 Plan) as a successor plan to the 1993 Plan. A total of 3,300,000 shares of common stock were initially reserved for issuance under the 2000 Plan. The 2000 Plan was amended in May 2002 to add 400,000 shares of common stock to the total available for issuance, amended in January 2004 to update certain administrative provisions, amended in September 2004 to add 2,380,000 shares of common stock to the total available for issuance under awards, and amended again on January 31, 2005 and March 17, 2005 to coordinate the provisions for change in control with the Company's change in control agreements and programs. The 2000 Plan provides for awards of up to 6,080,000 shares of common stock, plus 7,800,000 shares previously authorized under the 1993 Plan; provided, however, that the maximum aggregate number of shares which may be issued upon exercise of incentive stock options is 13,880,000 shares. The 2000 Plan is administered by the Compensation Committee as designated by the Board of Directors. The Compensation Committee's authority includes determining the number of options granted and vesting provisions. As of March 31, 2007, 2,702,847 shares were available for future grant.

As of March 31, 2007, the Company had outstanding 6,895,000 non-qualified common stock options issued outside of the 2000 Plan. These stock options were originally granted at exercise prices equal to the fair market value of its common stock on the grant date, as inducement grants to new executive officers and employees of the Company. Included in the 6,895,000 options were 2,000,000 options to the Company's President and Chief Executive Officer, 1,500,000 options to the Company's former President and Chief Executive Officer, 1,000,000 options to the Company's Executive Vice President and Chief Financial Officer, 850,000 options to the Company's Executive Vice President of Sales and Marketing, 800,000 options to the Company's then Senior Vice President of Sales and Service, 500,000 options to the Company's Vice President of Operations and an aggregate of 245,000 options to two employees. Additionally, the Company had outstanding 700,000 restricted stock units issued outside of the 2000 Plan. These restricted stock units were issued as inducement grants to new executive officers

of the Company. Included in the 700,000 units were 500,000 units to the Company's President and Chief Executive Officer and 200,000 units to the Company's Executive Vice President of Sales and Marketing. Although the options and units were not granted under the 2000 Plan, they were governed by terms and conditions identical to those under the 2000 Plan. All options granted are subject to the following vesting provision: one-fourth vests one year after the issuance date and 1/48th vests on the first day of each full month thereafter, so that all shall be vested on the first day of the 48th month after the issuance date. All outstanding options have a contractual term of ten years. All restricted stock units granted are subject to the following vesting provisions: one-fourth vests one year after the issuance date and one-fourth vests on the first day of each full year thereafter, so that all shall be vested on the first day of the fourth year after the issuance date.

During the year ended March 31, 2007, the Company issued a total of 2,850,000 non-qualified common stock options outside of the 2000 Plan at exercise prices equal to the fair market value of its common stock, as inducement grants to new executive officers of the Company. Included in the 2,850,000 options were 2,000,000 options to the Company's President and Chief Executive Officer and 850,000 options to the Company's Executive Vice President of Sales and Marketing. Effective July 31, 2006, 500,000 stock options were forfeited in accordance with the consulting agreement between the Company and its former Chief Executive Officer.

During the year ended March 31, 2006, the Company granted a total of 167,000 non-qualified common stock options to consultants under the 2000 Equity Incentive Plan (2000 Plan). The Company recorded \$0.2 million of stock-based compensation for these grants. The Company recorded stock based compensation for consultants as prescribed by SFAS No. 123. To estimate the fair value of the options, the Company utilized the Black-Scholes option pricing model even though such model was developed to estimate the fair value of freely tradable and fully transferable options, without vesting restrictions, which significantly differ from the Company's stock option awards. The Company issued a total of 1,500,000 non-qualified common stock options outside of the 2000 Plan at exercise prices equal to the fair market value of its common stock, as inducement grants to a new executive officer and an employee of the Company. Accordingly, no stock-based compensation was recorded for these grants. Included in the 1,500,000 options were 1,000,000 options to the Company's Executive Vice President and Chief Financial Officer (CFO) and 500,000 options to the Company's Vice President of Operations. Although the options were not granted under the 2000 Plan, they were governed by terms and conditions identical to those under the 2000 Plan. All options granted are subject to the following vesting provision: one-fourth vests one year after the issuance date and 1/48th vests on the first day of each full month thereafter, so that all shall be vested on the first day of the 48th month after the issuance date.

In July 2005, the Company entered into a General Release and Separation Agreement and a Consulting Agreement with its then Chief Financial Officer. The agreement provides for, among other items, a continuation of the vesting period of her then unvested common stock options through April, 2006, and consulting fees for three months. The Company recognized stock-based compensation of \$236,000 in the three months ended September 2005 based upon the fair value of the unvested options in accordance with SFAS No. 123 and EITF 96-18.

During the year ended March 31, 2005, the Company granted a total of 427,500 non-qualified common stock options to consultants under the 2000 Plan. The Company recorded \$0.1 million of stock-based compensation for these grants. The Company recorded stock based compensation for consultants as prescribed by SFAS No. 123. To estimate the fair value of the options, the Company utilized the Black-Scholes option pricing model even though such model was developed to estimate the fair value of freely tradable and fully transferable options, without vesting restrictions, which significantly differ from the Company's stock option awards.

During the year ended March 31, 2004, the Company issued a total of 4,195,000 non-qualified common stock options outside of the 2000 Plan at exercise prices equal to the fair market value of its common stock, as inducement grants to new executive officers and employees of the Company. Accordingly, no stock-based compensation was recorded for these grants. Included in the 4,195,000 options were 2,000,000 options to the Company's President and Chief Executive Officer (CEO), 800,000 options to the Company's then Senior Vice President of Sales and Service, 800,000 options to the Company's then Senior Vice President of Operations and an aggregate of 595,000 options to five employees. Although the options were not granted under the 2000 Plan, they were governed by terms and conditions identical to those under the 2000 Plan. All options are subject to the following vesting provision: one-fourth vests one year after the issuance date and 1/48th vests on the first day of each full month thereafter, so that all shall be vested on the first day of the 48th month after the issuance date.

On August 4, 2003, the Company sold 500,000 shares of restricted common stock at a price of \$0.001 per share to the Company's then new President and CEO as part of his compensation package. Deferred stock compensation of \$0.6 million was recorded based on the fair market value of the stock at the date of issuance. The restricted stock was subject to the following vesting provision: one-fourth vests one year after the issuance date and 1/48th vests on the first day of each full month thereafter, so that all shall be vested on the first day of the 48th month after the issuance date. Effective July 31, 2006, 125,000 unvested shares of restricted stock were repurchased and retired for \$125 by the Company in accordance with the consulting agreement between the Company and its former Chief Executive Officer.

In June 2000, the Company adopted the 2000 Employee Stock Purchase Plan (the Purchase Plan), which provides for the granting of rights to purchase common stock to regular full and part-time employees or officers of the Company and its subsidiaries. Under the Purchase Plan, shares of common stock will be issued upon exercise of the purchase rights. Under the Purchase Plan, an aggregate of 900,000 shares may be issued pursuant to the exercise of purchase rights. The maximum amount that an employee can contribute during a purchase right period is \$25,000 or 15% of the employee's regular compensation. Under the Purchase Plan, the exercise price of a purchase right is 95% of the fair market value of such shares on the last day of the purchase right period. The fair market value of the stock is its closing price as reported on the Nasdaq Stock Market on the day in question. As of March 31, 2007, 145,338 shares were available for future grant.

Valuation and Expense Information under SFAS 123(R)

For the fiscal year ended March 31, 2007, 2006 and 2005 the Company recognized stock-based compensation expense of \$2.7 million, \$1.0 million and \$0.4 million, respectively. The fair value of options vested during the fiscal year ended March 31, 2007, 2006 and 2005 was \$2.6 million, \$2.6 million and \$3.0 million, respectively. The Company has not capitalized as an asset any stock-based compensation costs.

The Company calculated the estimated fair value of each stock option on the date of grant using the Black-Scholes option-pricing model and the following weighted-average assumptions:

	Fiscal Year Ended March 31, 2007	
Risk-free interest rates	4.7	%
Expected lives (in years)	6.1	
Dividend yield		%
Expected volatility	101.3	%
Weighted average volatility	101.3	%

The Company's computation of expected volatility for the fiscal year ended March 31, 2007 was based on historical volatility. The Company estimated the expected life of each stock option granted in the fiscal year ended March 31, 2007 using the short-cut method permissible under SAB 107, which utilizes the weighted average expected life of each tranche of the stock option, determined based on the sum of each tranche's vesting period plus one-half of the period from the vesting date of each tranche to the stock option's expiration. This method is available for options granted prior to December 31, 2007. The risk-free interest rate is based on the implied yield available on U.S. Treasury securities with an equivalent remaining term. Included in the calculation is the Company's estimated forfeiture rate. SFAS 123(R) requires that equity-based compensation expense be based on awards that are ultimately expected to vest and accordingly, equity-based compensation recognized in the fiscal year ended March 31, 2007, has been reduced by estimated forfeitures. Our estimate of forfeitures is based on historical option forfeiture behavior.

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

Information relating to all outstanding stock options, except for rights associated with the Purchase Plan, is as follows:

	Shares	Weighted-Average Exercise Price	Weighted-Average Remaining Contractual Term (in years)	Aggregate Intrinsic Value
Options outstanding at March 31, 2004	8,090,573	\$ 2.69		
Granted	2,137,591	\$ 1.81		
Exercised	(212,619)	\$ 0.69		
Forfeited, cancelled or expired	(972,121)	\$ 3.40		
Options outstanding at March 31, 2005	9,043,424	\$ 2.46		
Granted	3,223,300	\$ 2.65		
Exercised	(903,658)	\$ 1.77		
Forfeited, cancelled or expired	(991,048)	\$ 2.56		
Options outstanding at March 31, 2006	10,372,018	\$ 2.58		
Granted	4,231,600	\$ 1.44		
Exercised	(1,030,173)	\$ 1.58		
Forfeited, cancelled or expired	(3,255,464)	\$ 3.48		
Options outstanding at March 31, 2007	10,317,981	\$ 1.93	8.15	\$ 265,133
Options fully vested at March 31, 2007 and those expected to vest beyond March 31, 2007	8,867,878	\$ 1.98	7.95	\$ 195,274
Options exercisable at March 31, 2007	4,385,663	\$ 2.21	6.74	\$ 30,936

The weighted average per share grant date fair value of options granted during the fiscal years ended March 31, 2007, 2006 and 2005 was \$1.18, \$2.13 and \$1.43, respectively. The total intrinsic value of options exercised by the Company from option exercises during the fiscal years ended March 31, 2007, 2006 and 2005, was approximately \$1.4 million, \$1.9 million and \$0.4 million, respectively. As of March 31, 2007, there was approximately \$7.2 million of unrecognized compensation cost related to stock option awards that is expected to be recognized as expense over a weighted average period of 1.61 years.

Edgar Filing: CAPSTONE TURBINE CORP - Form 10-K

Additional information regarding options outstanding at March 31, 2007 is as follows:

Exercise Price	Options Outstanding			Options Exercisable	
	Number of Shares Outstanding at March 31, 2007	Weighted Average Remaining Contractual Life (in years)	Weighted Average Exercise Price	Exercisable at March 31, 2007	Weighted Average Exercise Price
Up to \$1.00	1,357,312	9.21	\$ 0.86	104,500	\$ 0.76
\$1.01 to \$2.00	5,983,328	7.86	\$ 1.41	3,148,507	\$ 1.43
\$2.01 to \$5.00	2,786,641	8.36	\$ 2.77	990,731	\$ 2.79
Greater than \$5.00	190,700	6.45	\$ 13.71	141,925	\$ 16.51
	10,317,981	8.15	\$ 1.93	4,385,663	\$ 2.21

A summary of restricted stock activity for the year ended March 31, 2007 is as follows:

Restricted Stock Awards	Shares	Weighted Average Grant Date Fair Value
Nonvested restricted stock awards outstanding at March 31, 2006	177,083	\$ 1.23
Granted	45,877	\$ 1.56
Vested	(97,960)	\$ 1.38
Forfeited	(125,000)	\$ 1.23
Nonvested restricted stock awards outstanding at March 31, 2007		\$

The restricted stock awards vest immediately or in equal installments over a period of four years. The restricted stock awards were valued based on the closing price of the Company's common stock on the date of grant, and compensation cost is recorded on a straight-line basis over the share vesting period.

Restricted Stock Units	Shares	Weighted Average Grant Date Fair Value
Nonvested restricted stock units outstanding at March 31, 2006		\$
Granted	1,086,536	\$ 1.36
Vested and issued		\$
Forfeited	(24,300)	\$ 1.91
Nonvested restricted stock units outstanding at March 31, 2007	1,062,236	\$ 1.35

The restricted stock units vest in equal installments over a period of two to four years. The restricted stock units were valued based on the closing price of the Company's common stock on the date of grant, and compensation cost is recorded on a straight-line basis over the share vesting period.

On December 18, 2006 the Company issued restricted stock units for 500,000 shares of the Company's common stock to the Company's President and Chief Executive Officer that will become 25% vested each year of service over four years.

The Company recorded expense of approximately \$0.3 million, \$0.1 million and \$0.1 million associated with its restricted stock awards and units for fiscal years ended March 31, 2007, 2006 and 2005, respectively. As of March 31, 2007, there was

approximately \$0.9 million of unrecognized compensation cost related to restricted stock units that is expected to be recognized as expense over a weighted average period of 1.94 years.

Stockholder Rights Plan

On July 7, 2005, the Company entered into a rights agreement with Mellon Investor Services LLC, as rights agent. In connection with the rights agreement, the Company's board of directors authorized and declared a dividend distribution of one preferred stock purchase right for each share of the Company's common stock authorized and outstanding at the close of business on July 18, 2005. Each right entitles the registered holder to purchase from the Company a unit consisting of one one-hundredth of a share of Series A Junior Participating Preferred Stock, par value \$0.001 per share, at a purchase price of \$10.00 per unit, subject to adjustment. The description and terms of the rights are set forth in the rights agreement. Initially, the rights will be attached to all common stock certificates representing shares then outstanding, and no separate rights certificates will be distributed. Subject to certain exceptions specified in the rights agreement, the rights will separate from the common stock and will be exercisable upon the earlier of (i) 10 days following a public announcement that a person or group of affiliated or associated persons has acquired, or obtained the right to acquire, beneficial ownership of 15% or more of the outstanding shares of common stock, other than as a result of repurchases of stock by the Company or certain inadvertent actions by institutional or certain other stockholders, or (ii) 10 days (or such later date as the Company's board of directors shall determine) following the commencement of a tender offer or exchange offer (other than certain permitted offers described in the rights agreement) that would result in a person or group beneficially owning 15% or more of the outstanding shares of the Company's common stock. The rights expire on July 18, 2015, unless such date is extended or the rights are earlier redeemed or exchanged by the Company. The rights are intended to protect the Company's stockholders in the event of an unfair or coercive offer to acquire the Company. The rights, however, should not affect any prospective offeror willing to make an offer at a fair price and otherwise in the best interests of the Company and its stockholders, as determined by the board of directors. The rights should also not interfere with any merger or other business combination approved by the board of directors.

Recent Registered Direct Offering and Placement of Common Stock

Effective January 24, 2007, the Company completed a registered direct placement in which it sold 40,000,000 shares of common stock of the Company, par value \$0.001 per share, and warrants to purchase 20,000,000 shares of common stock with an initial exercise price of \$1.30 per share, at a price of \$1.14 per unit. The five-year warrants are immediately exercisable and include anti-dilution provisions, subject to certain limitations.

The sale resulted in gross proceeds of \$45.6 million and proceeds net of direct incremental costs of the offering of \$42.4 million.

Effective October 21, 2005, the Company completed a registered direct offering of the Company's common stock whereby it issued a total of 17 million shares of its common stock, resulting in gross proceeds of approximately \$41.4 million. The Company incurred approximately \$2.2 million in direct costs associated with the offering.

9. Commitments and Contingencies

As of March 31, 2007, the Company had firm commitments to purchase inventories of approximately \$6.3 million.

The Company leases offices and manufacturing facilities under various non-cancelable operating leases expiring at various times through the fiscal year ended March 31, 2011. All of the leases require the Company to pay maintenance, insurance and property taxes. The lease agreements for primary office and manufacturing facilities provide for rent escalation over the lease term and renewal options for five year periods. Rent expense is recognized on a straight-line basis over the term of the lease. The difference between rent expense recorded and the amount paid is credited or charged to deferred rent which is included in Other Long-term Liabilities in the accompanying consolidated balance sheets. Deferred rent amounted to \$0.6 million and \$0.6 million as of March 31, 2007 and 2006, respectively. Rent expense amounted to approximately \$2.3 million, \$2.1 million and \$2.0 million for the years ended March 31, 2007, 2006 and 2005, respectively.

At March 31, 2007, the Company's minimum commitments under non-cancelable operating leases were as follows:

Year Ending March 31,	Operating Leases (In thousands)
2008	\$ 2,065
2009	2,121
2010	2,149
2011	913
Total minimum lease payments	\$ 7,248

The Company has automobiles that it has financed with notes payable. The outstanding balances of the notes payable as of March 31, 2007 and 2006 were \$47,000 and \$66,000, respectively. The notes bear interest at 0.9% with principal and interest paid monthly through August 2009. The related automobiles collateralize the notes payable.

In 2000, the Department of Energy (DOE) awarded the Company \$10.0 million under a Cooperative Agreement to develop an Advanced Microturbine System. The \$10.0 million award was to be distributed during the project period September 28, 2000 through July 1, 2005. In April 2005, the DOE amended the agreement and added a task to develop an Ultra-Low Emissions Microturbine. The award was increased to a total of \$17.7 million and the project period was extended through December 31, 2008. The program is estimated to cost the Company a total of \$31.7 million over the eight year period, which would require the Company therefore expense approximately \$18.2 million of the total R&D expenditures under this program. The Company billed the DOE under this agreement a cumulative amount of \$13.4 million through March 31, 2007. The Company's remaining funding under this program is approximately \$4.3 million as of March 31, 2007 which would require the Company to provide at least \$6.2 million of additional R&D expenditures.

In 2001, the Company was awarded a \$3.0 million grant from the DOE for the research, development and testing of packaged cooling, heating and power systems for buildings. The contract is estimated to cost \$5.5 million, which would therefore require the Company to expense approximately \$2.5 million of the total R&D expenditures under this program. The Company billed the DOE under this contract a cumulative amount of \$1.3 million through March 31, 2007. The Company's remaining funding under this program is approximately \$3.0 million as of March 31, 2007 which would require the Company to provide at least \$4.3 million of its own R&D expenditure. However, the Company does not expect to continue work under this specific project. Total offsets to R&D expenses such as the DOE award amounted to \$1.8 million, \$2.5 million and \$0.5 million for the years ended March 31, 2007, 2006 and 2005, respectively.

Agreements the Company has with some of its distributors and Authorized Service Companies (ASCs) require that if the Company renders parts obsolete in inventories they own and hold in support of their obligations to serve fielded microturbines, then the Company is required to replace the affected stock at no cost to the distributors or ASCs. While the Company has never incurred costs or obligations for these types of replacements, it is possible that future changes in the Company's product technology could result and yield costs to the Company if significant amounts of inventory are held at ASCs. As of March 31, 2007, no significant inventories were held at ASCs.

In December 2001, a purported shareholder class action lawsuit was filed in the United States District Court for the Southern District of New York (the District Court) against the Company, two of its then officers, and the underwriters of the Company's initial public offering. The suit purports to be a class action filed on behalf of purchasers of the Company's common stock during the period from June 28, 2000 to December 6, 2000. An amended complaint was filed on April 19, 2002. The Plaintiffs allege that the underwriter defendants agreed to allocate stock in the Company's June 28, 2000 initial public offering and November 16, 2000 secondary offering to certain investors in exchange for excessive and undisclosed commissions and agreements by those investors to make additional purchases of stock in the aftermarket at pre-determined prices. The Plaintiffs allege that the prospectuses for these two public offerings were false and misleading in violation of the securities laws because they did not disclose these arrangements. In June 2004, a committee of our Board of Directors approved a proposed partial settlement with the plaintiffs in this matter. The settlement would have provided, among other things, a release of the Company and of the individual defendants for the wrongful conduct alleged in the Amended Complaint in exchange for a guarantee from the Company's insurers regarding recovery from the underwriter defendants and other non-monetary consideration from the Company regarding its underwriters. The Plaintiffs have continued to litigate against the underwriter defendants. The District Court directed that the litigation proceed within a number of focus cases rather than all

of the 310 cases that have been consolidated. The Company's case is not one of these focus cases. On October 13, 2004, the District Court certified the focus cases as class actions. The underwriter defendants appealed that ruling, and on December 5, 2006, the Court of Appeals for the Second Circuit reversed the District Court's class certification decision. On April 6, 2007, the Second Circuit denied the Plaintiffs' petition for rehearing. In light of the Second Circuit opinion, liaison counsel for all issuer defendants, including the Company, informed the District Court that this settlement cannot be approved because the defined settlement class, like the litigation class, cannot be certified. We cannot predict whether we will be able to renegotiate a settlement that complies with the Second Circuit's mandate. Because of the inherent uncertainties of litigation, we cannot accurately predict the ultimate outcome of the matter.

A demand for arbitration was filed in March 2004 by Interstate Companies, Inc. (Interstate), a company that conducts business with the Company. Interstate claimed damages for breach of contract in excess of \$10 million. On December 30, 2005, the Company entered into a Confidential Settlement Agreement and Mutual Release (Settlement Agreement) with Interstate, whereby all disputes between Interstate and the Company were amicably resolved. Pursuant to the Settlement Agreement, the Company paid Interstate \$2.3 million on December 30, 2005 and the parties agreed to release each other from any and all claims. The Company had accrued \$0.3 million of the expense during Fiscal 2005 and recorded the remaining \$2.0 million of the expense in selling, general and administrative cost in Fiscal 2006.

From time to time, the Company may become subject to additional legal proceedings, claims and litigation arising in the ordinary course of business. Other than the matters discussed above, the Company is not a party to any other material legal proceedings, nor is the Company aware of any other pending or threatened litigation that would have a material adverse effect on the Company's business, operating results, cash flows or financial condition should such litigation be resolved unfavorably.

10. Employee Benefit Plans

The Company maintains a defined contribution 401(k) profit-sharing plan in which all employees are eligible to participate. Employees may contribute up to Internal Revenue Service annual limits or, if less, 90% of their eligible compensation. Employees are fully vested in their contributions to the plan. The plan also provides for both Company matching and discretionary contributions, which are determined by the Board of Directors. The Company began matching 50 cents on the dollar up to 4% of the employee's contributions in October 2006. Prior to that date, no Company contributions had been made since the inception of the plan. The Company's match vests 25% a year, over four years starting from the employee's hire date. The expense recorded by the Company for the year ended March 31, 2007 was approximately \$95,000.

The Company has a deferred compensation plan providing eligible executives with the opportunity to participate in an unfunded, deferred compensation program. Under the program, participants may defer base compensation and bonuses and earn interest on their deferred amounts. The program is not qualified under Section 401 of the Internal Revenue Code. The balance of participant deferrals and earnings thereon was \$18,000 and \$68,000 at March 31, 2007 and 2006, respectively, which is included in Other Long-Term Liabilities. The participant deferrals earn interest at the prime interest rate set by Wells Fargo Bank plus 1% per year.

11. Related Party Transactions

In October 2002, the Company entered into a strategic alliance with UTC, a stockholder, through its UTC power division. In March 2005, the Company and UTC replaced the strategic alliance agreement with an original equipment manufacturer agreement (the OEM Agreement) between the Company and UTC Power LLC (UTCP). The OEM Agreement involves the integration, marketing, sales and service of CCHP solutions worldwide. Sales to UTC's affiliated companies were approximately \$2.4 million, \$4.2 million and \$2.5 million for the fiscal years ended March 31, 2007, 2006 and 2005, respectively. Related accounts receivable were \$0.8 million, \$0.3 million and \$1.5 million at March 31, 2007, 2006 and 2005, respectively. In December 2003, the Company engaged United Technologies Research Center (UTRC) to be a subcontractor of the Company in relation to one of the awards that the Company received from the Department of Energy (the DOE). UTRC is the research and development branch of UTC. UTRC billed the Company \$0 and \$38,600 under this subcontract for the year ended March 31, 2007 and 2006, respectively, and the Company had no unpaid balances with UTRC at March 31, 2007 or March 31, 2006.

On September 11, 2005, the Company gave notice to UTCP, pursuant to the OEM Agreement, of certain breaches of the OEM agreement by UTCP, including failure to meet sales targets for the year. With respect to most of the breaches, UTCP had 90 calendar days following its receipt of the notice in which to cure the breaches. The Company could elect to terminate the OEM Agreement if UTCP fails to cure the breaches. While management believes that UTCP has not yet cured some key breaches of the agreement, the Company has not terminated the agreement. Additionally, as the Company continues to work with UTCP under the existing OEM Agreement, it has encouraged UTCP to resolve the underlying causes of the breaches. If this relationship is terminated, the Company will honor sales orders committed to prior to the date of termination in accordance with the OEM Agreement.

In October 2002, the Company entered into a Transition Agreement and Mutual Release with its then President and Chief Executive Officer. On February 27, 2003, the Board accepted his resignation as President and Chief Executive Officer and a

member of the Board. He continued as an employee and a senior advisor to the Company through May 6, 2003. Under the transition agreement, he continued to receive his monthly salary for six months through May 6, 2003, which totaled approximately \$0.2 million, he received incentive consideration of \$0.1 million upon executing a Supplemental Release and he received approximately \$0.2 million, payable in equal installments, less applicable withholding taxes, during the twelve-month period following his separation as an employee. In May 2003, the Company entered into a consulting agreement with him, which provides payment of \$5,921 monthly in arrears for 38 months through June 2006. His payment will be reduced by 50% if he engages in any full-time employment. His stock options will also continue to vest through June 2006. Accordingly, non-employee stock-based compensation pertaining to this modification is re-measured and recorded at each vesting period and amounted to \$0, \$31,000 and \$22,000 for the years ended March 31, 2007, 2006 and 2005, respectively.

In July 2005, the Company entered into a Separation and Consulting Agreement with its then CFO. The agreement provided, among other items, an acceleration of vesting of her then unvested common stock options. The Company recognized stock-based compensation of \$236,000 for the year ended March 31, 2006 based upon the intrinsic value of the unvested options that became vested. The Company paid the former CFO a severance payment of \$188,000 in Fiscal 2006.
